Three Centuries of Luxury Textile Consumption in the Low Countries and England, 1330 - 1570: New Methodologies for Estimating Changes in Real Textile Values over Time

Abstract:

by John Munro (University of Toronto)

This study is a much revised and extended version of two previously issued working papers on the production, sale, and consumption of woollen textiles in England and the Low Countries, from the fourteenth to the sixteenth centuries. It focuses on the hey-day of the production and international trade in heavy-weight, very high quality, luxury woollen broadcloths (Flemish and English), during these three centuries. From the 1290s to the 1460s, as I have argued in earlier publications, the consequences of widespread international warfare, and the consequent dislocations to major trading routes, the sharp rise in transportation and transaction costs, and taxation, combined with disruptive coinage debasements and various trade barriers, and drastic declines in population (from plagues and warfare) produced major transformations in the international trade and production of textiles: a relative shift from cheaper line textiles (whose producers were price-takers) to very high priced luxury textiles — silks and woollens (whose producers were price-makers). Table 1 provides the wool compositions, dimensions, and weights of the various textiles. The major concern

of this study is to estimate changes in the ‘real’ value of luxury woollen over these three centuries, especially for the longest price series: for the Ghent *dickedinnen* broadcloths, from the 1330s to the 1570s. The available price data are, of course, in current money-of-account: the *pond groot* of Flanders. Because of the chronic coinage debasement that afflicted this era, we cannot use current prices. Thus, for example, in the two centuries from 1350 to 1550, the quantity of fine silver in the Flemish penny or *groot* was reduced, in both fineness and weight, from 2.067 grams to 0.474 g — an overall reduction of 77.1 percent; and by 1580, that quantity had fallen to just 0.300 g. Most historians have sought a false remedy for this problem of coinage debasement: to estimate ‘real’ prices in terms of ‘silver equivalents’, i.e., the quantity of fine silver represented in the current circulating silver penny and thus in the penny (1d) of the money-of-account. Why this method is fallacious (in several respects) is a major aspect of this paper.

Instead, three alternative methods of estimating real values over time have been utilized. The first is a method similar to the common calculation of real wages ($NWI/CPI = RWI$): that is, using a common base period of 1451-75 for all prices, I have calculated price indexes for all the textiles (Flemish and English) in this study; and I have then divided that index by the Consumer Price Indexes for Flanders, Brabant, and England (Table 18). If the textile price index rose more than did the CPI, its real value had also risen. The second and related method does not involve index numbers, but a comparison of the market values of the three ‘baskets of consumables’ with those of the textiles: the *number* of such ‘baskets of consumables’ whose market value equalled the value of each of the luxury woollen broadcloths under consideration, over these three centuries. The third method involves the purchasing power of labour: using my own tabulations of daily money wages for master masons and carpenters in the leading towns of Flanders, Brabant, and England, over these centuries, I have calculated the number of days’ wages that a master mason would have required to buy a unit of these textiles, over these three centuries.

For any short period, such as that given in Table 2 (1535-44), comparing values of woollens and worsteds, all three methods provide the same results. But over the *longue durée* of this study, from the 1330s to the 1570s, these methods often produce differing results: for sometimes the real values of these textiles in terms of masons’ wages rose, while their values in terms of commodity baskets fell. The explanation for such a divergence is that the MRP of labour and the purchasing power of masons’ wages did not change in accordances with changes in the real values of the commodities in the ‘baskets of consumables’. The study ends by demonstrating the enormous differences in the purchasing power of modern-day building craftsmen with that of sixteenth-century craftsmen — and the sharp fall in the percentage shares of textiles and foodstuffs in the consumer price indexes, then and now (i.e., in Canada, in 2008).

Three Centuries of Luxury Textile Consumption in the Low Countries and England, 130 - 1570:

New Methodologies for Estimating Changes in Real Textile Values over Time

by John Munro (University of Toronto)

Luxury textiles: an overview of late-medieval cloth production, trade, and consumption

If mankind's three basic necessities have always been food, clothing, and shelter, whose production, trade, and consumption have rightly been a primary focus of economists and historians for many generations, we may ask this vital question: how do we distinguish between necessities and luxury products? Indeed, any examination of later-medieval and early-modern commodity prices reveals that for all three of these basic categories there was a seamless continuum from the very cheapest to the most expensive goods sold on the market, so that making clear cut divisions becomes virtually impossible. How and why did and does the consumption of food and drink, for example, shift from being a basic necessity to ensure survival to become a luxury that enhances and enriches the quality of life?¹

Obviously the very same considerations apply to clothing as well. For many people, if only for a much smaller segment of the population, chiefly to be found in the aristocracy, the higher clergy, and wealthy bourgeoisie, clothing has also served and still serves other wants, in terms of luxury consumption: for decoration and for the assertion of personal values, and especially of one's social status. Indeed, for such

¹ If today, beer and wine may be considered luxuries, justifiably subjected to 'sin taxes', they were necessities in pre-modern times, because of the inherent dangers in drinking contaminated water and milk. On this point, see: ; and also (on beer and wine), John Munro, 'The Usury Doctrine and Urban Public Finances in Late-Medieval Flanders (1220 - 1550): Rentes (Annuities), Excise Taxes, and Income Transfers from the Poor to the Rich', in Simonetta Cavaciocchi, ed., *La fiscalità nell'economia Europea, secc. XIII - XVIII/ Fiscal Systems in the European Economy from the 13th to the 18th Centuries*, Atti della 'Trentanovesima Settimana di Studi', 22 - 26 aprile 2007, Fondazione Istituto Internazionale di Storia Economica "F. Datini", Prato, Serie II: Atti delle "Settimane di Studi" et altri Convegni 39 (Florence: Firenze University Press, 2008), pp. 995-98. For consumption of food and drink: see also Raymond Van Uytven, *Production and Consumption in the Low Countries, 13th - 16th Centuries*, Variorum Collected Studies Series CS 714 (Aldershot: Ashgate-Variorum, 2001); Raymond Van Uytven, ed., *Van Rank tot Drank* (Brussels: Algemeen Spaar en Lijfrent Kas-Galerie, 2003); Raymond Van Uytven, *Geschiedenis van de dorst: twintig eeuwen drinken in de Lage Landen* (Leuven: Davidsfond, 2007); Richard W. people, luxury textiles may have been and still are deemed as personal ‘necessities’.

For later-medieval and early-modern Europe, one may cite the wide variety of sumptuary legislation, by which royalty and the aristocracy sought to prevent the lower classes – the lower bourgeoisie and working classes – from seeking to emulate their ‘betters’ in the modes of dress that they were permitted to wear.² Not only the very detailed sumptuary legislation, but also a remarkable series of annual textile prices, a wide variety of other commodity prices, and urban industrial wages in the late-medieval and early-modern Low Countries and England, together allow us to measure changes in real values of various textiles in these two regions for almost three centuries, from the fourteenth to the sixteenth, and to make comparisons with modern-day consumption patterns.³

³ The sources for all these price and wage data are given in the tables in the Appendix. For comparative textile prices, including those in the Mediterranean and Poland, see nn. 18, 20.

The relative shift to luxury textiles in late-medieval international trade

In the late-medieval European economy, for a variety of other reasons, costly luxury textiles gained a relatively even more important role in both manufacturing and international trade than they had enjoyed before the fourteenth century.⁴ As I have contended in other publications, the spreading stain of warfare – international, regional, and local or regional civil wars – beginning in the 1290s, and continuing into the Hundred Years' War (1337-1453), brought about drastic alternations in the structure of international trade that directly or indirectly favoured the production of luxury textiles. In essence, both the economic and political consequences of such chronic, widespread warfare, combined with a drastic fall in population after the Black Death, raised the transaction costs of long-distance trade, in terms of transportation, protection, and marketing costs, while also raising the taxation of trade, to often prohibitive levels. Indeed, those rising transportation and transaction costs virtually eliminated the long-distance commerce in the cheaper textiles from north-west Europe to the far distant Mediterranean basin, all the more so since transaction costs are a fundamentally a function of both security and scale-economies, both of which were greatly reduced by the post-Plague demographic decline and chronic warfare.⁵ That was all the more true for those who produced

⁵ See Douglass North, 'Transaction Costs in History', *Journal of European Economic History*, 14 (1985), 557-76; Douglass North and Robert Thomas, *The Rise of the Western World: A New Economic History* (Cambridge, 1973), pp. 71-96, 134-38; Douglass North, *Structure and Change in Economic History* (New York, 1981), chapters 1-5; Douglass North, 'Government and the Cost of Exchange in History', *Journal of Economic History*, 44 (1984), 255-64; Clyde G. Reed, 'Transactions Costs and Differential Growth in Seventeenth Century Western Europe', *Journal of Economic History*, 33 (March 1973), 177 - 90, especially pp. 180-86. Many aspects of North's 'transaction costs' model can be found earlier in: Frederic Lane, 'National Wealth and Protection Costs', in Jesse Clarkson and Thomas C. Cochran, eds., *War as a Social Institution: the Historian's Perspective* (New York, 1941), pp. 32-43, subsequently revised as the following: 'The Economic Meaning of War and Protection', *Journal of Social Philosophy and Jurisprudence*, 7 (1942), 254-70; Lane, 'Force and Enterprise in the Creation of Oceanic Commerce', *Journal of Economic History*, 10 (1950), 19-31, published as the supplement *The Task of Economic History*; and Lane, 'Economic Consequences of Organized Violence', *Journal of Economic History*, 18 (1959), 401-17. All have been

cheap textiles that lacked any distinguishing features, and were indeed undistinguishable from almost identical cheaper products produced in the Mediterranean basin itself. Necessarily acting as ‘price takers’, these northern producers thus were unable to raise prices to compensate for rising transaction costs.

The chief beneficiaries of these structural changes in the late-medieval international trade in textiles were evidently those producing luxury products: not just those producing very costly silks,⁶ but even more so, those manufacturing heavy-weight, expensively dyed woollen broadcloths, all made from the very finest wools and dyestuffs. For only such luxury textiles were able to sustain these rising marketing and other transaction costs, especially to and in the Mediterranean basin, which remained by far the most important market zone for the European economy. Furthermore, producers of luxury woollens had always striven to differentiate their products by distinguishing superior quality over those of their competitors. Thus acting as ‘price-makers’, in the context of ‘monopolistic competition’, they were better able to raise their prices, for a much smaller, wealthier market. In any event, rising transaction costs were a far smaller proportion of final retail prices for luxury goods. Consequently, the late-medieval Low Countries, northern France, England, and even Italy, experienced a major reorientation in textile production and trade away from the *sayetteries* (*worsted* industries, in England) to an overwhelming concentration on heavy-weight luxury woollens, whose

republished in his *Venice and History: the Collected Papers of Frederic C. Lane* (Baltimore, 1966), pp. 373-428.

⁶ Certainly the most luxurious and most costly of all textiles worn in later-medieval and early-modern Europe were those woven from silk; but we cannot include silk-based textiles in these comparisons for two reasons: first, they came in a such a wide variety of fabrics (damasks, satins, velours, etc.), which, in turn lacked any real consistency in dimensions; and second, we do not possess a consecutive series of market prices, as we do for woollens. For the late-medieval silk industry, see John Munro, ‘Silk’, in Joseph R. Strayer, et al., eds, *Dictionary of the Middle Ages*, 13 vols. (New York: Charles Scribner's Sons/MacMillan, 1982-88), Vol. 11: *Scandinavian Languages to Textiles, Islamic* (New York, 1988), pp. 293-96; Giovanni Federico, ‘Silk Industry, in Joel Mokyr, ed., *The Oxford Encyclopedia of Economic History*, 5 vols. (Oxford and New York: Oxford University Press, 2003), vol. 4, pp. 483-91; Luca Mola, *La seta in Italia dal Medioevo al Seicento: dal baco al drappo* (Marsilio, 2000); Luca Mola, *The Silk Industry of Renaissance Venice* (Johns Hopkins University Press, 2000); Paola Lanaro, ed., *At the Centre of the Old World: Trade and Manufacturing in Venice and the Venetian Mainland, 1400 - 1800*, Publications of the Centre for Reformation and Renaissance Studies: Essays and Studies no. 9 (CRRSS: Victoria University in the University of Toronto, 2006); Simonetta Caviacocchi, ed., *La seta in Europa sec. XIII-XX : atti della ‘Ventiquattresima Settimana di studi’*, 4-9 maggio 1992, Istituto internazionale di storia economica F. Datini (Le Monnier, 1993). See also, n. 20 below.

chief markets came to be those in the Baltic and northern Europe.⁷

Since the single most important component of luxury woollens was fine English wool, the Low Countries' draperies had no choice but to accept, from the 1330s, an increasingly extortionate taxation of English wool exports, which further and very substantially raised their costs and prices all the more.⁸

⁷ For evidence, see my prior publications, in particular: John H. Munro, 'Urban Regulation and Monopolistic Competition in the Textile Industries of the Late-Medieval Low Countries', in Erik Aerts and John Munro, eds., *Textiles of the Low Countries in European Economic History*, Studies in Social and Economic History, Vol. 19 (Leuven: Leuven University Press, 1990), pp. 41 - 52; John Munro, 'Industrial Transformations in the North-West European Textile Trades, c. 1290 - c. 1340: Economic Progress or Economic Crisis?' in Bruce M. S. Campbell, ed., *Before the Black Death: Studies in the 'Crisis' of the Early Fourteenth Century* (Manchester and New York: Manchester University Press, 1991), pp. 110 - 48; John Munro, 'Patterns of Trade, Money, and Credit', in James Tracy, Thomas Brady Jr., and Heiko Oberman, eds., *Handbook of European History in the Later Middle Ages, Renaissance and Reformation, 1400 - 1600*, Vol. I: *Structures and Assertions* (Leiden: E.J. Brill, 1994), pp. 147-95; John Munro, 'Industrial Entrepreneurship in the Late-Medieval Low Countries: Urban Draperies, Fullers, and the Art of Survival', in Paul Klep and Eddy Van Cauwenberghe, eds., *Entrepreneurship and the Transformation of the Economy (10th - 20th Centuries): Essays in Honour of Herman Van der Wee* (Leuven: Leuven University Press, 1994), pp. 377-88; John Munro, 'Anglo-Flemish Competition in the International Cloth Trade, 1340 - 1520', *Publication du centre européen d'études bourguignonnes*, 35 (1995), 37-60 [*Rencontres d'Oxford (septembre 1994): L'Angleterre et les pays bas bourguignonnes: relations et comparaisons, XVe - XVIe siècle*, ed. Jean-Marie Cauchies]; John Munro, 'The Origins of the English 'New Draperies': The Resurrection of an Old Flemish Industry, 1270 - 1570', in Negley B. Harte, ed., *The New Draperies in the Low Countries and England, 1300 - 1800*, Pasold Studies in Textile History no. 10 (Oxford and New York: Oxford University Press, 1997), pp. 35-127; John Munro, 'The Symbiosis of Towns and Textiles: Urban Institutions and the Changing Fortunes of Cloth Manufacturing in the Low Countries and England, 1270 - 1570', *The Journal of Early Modern History: Contacts, Comparisons, Contrasts*, 3:1 (February 1999), 1-74; John Munro, 'The Low Countries' Export Trade in Textiles with the Mediterranean Basin, 1200-1600: A Cost-Benefit Analysis of Comparative Advantages in Overland and Maritime Trade Routes', *The International Journal of Maritime History*, 11:2 (Dec. 1999), 1 - 30; John Munro, 'The "Industrial Crisis" of the English Textile Towns, 1290 - 1330', *Thirteenth-Century England: VII*, ed. (Cambridge and New York: Cambridge University Press, 2003), Vol. I, chapter 5, pp. 228-324, 378-86. For Italy in particular, see also John Munro, 'I panni di lana', in Luca Ramin (editor in chief), *Il Rinascimento italiano et l'Europa*, vol. IV: *Commercio e cultura mercantile*, ed. by Franco Franceschi, Richard Goldthwaite, and Reinhold Mueller (Fondazione Cassamarca: Angelo Colla Editore: Treviso, 2007), pp. 105-41.

⁸ See the sources cited in n. 7, in particular, Munro, 'Medieval Woollens', pp. 278-83; and see also W. M. Ormrod, 'The Crown and the English Economy, 1290 - 1348', in Bruce M.S. Campbell, ed., *Before the Black Death: Studies in 'Crisis' of the Early Fourteenth Century* (Manchester and New York, 1991), pp. 149 - 83.

Nevertheless, so long as this region's luxury woollen industries continued to prove successful in convincing their customers in widely diverse European and also Islamic (chiefly Ottoman) markets of the distinctively superior quality of their cloths, they were able to set prices that would continue to maintain profits, even with a smaller sales volume, despite rising raw material and transaction costs, in international trade.⁹

The sixteenth-century revival of long distances trade in cheaper textiles: industrial changes

By the early sixteenth century, however, a combination of macro-economic and micro-economic factors combined to lower transportation and transaction costs in international trade, with significant consequences for the European textile industries. The most important factors in these cost reductions were: a relative diminution in warfare, and thus an increase in relative security; renewed demographic growth, especially with a dramatic and disproportionate growth in urban populations that led to superior scale economies in international trade; and major innovations in marketing, and both sea-borne and land transportation.¹⁰ Those much more propitious economic circumstances thereby acted to promote a recovery and renewed expansion in the international trade in relatively less expensive, chiefly lighter textiles, whose

⁹ See the sources cited in my publications in n. 7 above.

chief markets were again found mainly in the Mediterranean basin, and, this time, also in the Spanish New World – in warmer climate zones that provided better markets for lighter textiles.¹¹

The chief beneficiary of these structural changes in international trade in textiles during the early to mid-sixteenth century were the worsted-type *sayetteries* of the southern Low Countries, led by the Flemish town of Hondschoote, whose light-weight, relatively inexpensive textiles were exported chiefly to this region, especially to Italy and Spain. By the 1530s, they had become the predominant, leading sector of the Low Countries textile industries.¹² Furthermore, even before the 1530s, this region's luxury woollen cloth industries had largely succumbed, though never entirely, to the overwhelming competition in most European textile markets from the much lower-cost (because woven from tax-free wools), more cheaply-priced, but still luxury-quality English woollen broadcloths. Such once renowned and very prominent luxury woollen draperies, as represented here, from both Ghent (Flanders) and Mechelen (Brabant), had managed to survive into the sixteenth century, though almost as shadows of their former selves, by serving a very narrow market niche of the ultra-rich in European society.¹³

Fortunately, we have, in Table 2, a list of comparative textile prices and 'real' values in the southern

¹¹ See the publications cited in nn. 7 and 10, above.

¹² See sources cited in n. 7 above; and also: Emile Coornaert, *La draperie-sayetterie d'Hondschoote, XIVe-XVIIIe siècles* (Paris, 1930); Emile Coornaert, *Une industrie urbaine du XIVe au XVIIe siècle: l'industrie de la laine à Bergues-Saint-Winoc* (Paris, 1930); Emile Coornaert, 'Draperies rurales, draperies urbaines: l'évolution de l'industrie flamande au moyenâge et au XVI siècle', *Belgische tijdschrift voor filologie en gescheidenis/Revue belge de philologie et d'histoire*, 28 (1950), 60-96; Jan Craeybeckx, 'L'industrie de la laine dans les anciens Pays-Bas méridionaux de la fin du XVIe au début du XVIIIe siècle', in Marco Spallanzani, ed., *Produzione, commercio e consumo dei panni di lana* (Florence, 1976), pp. 21-43. In the 1560s, the production of woollen cloths from the *nouvelles draperies* and the very few remaining traditional draperies in the southern Low Countries was then about 2.07 million metres, while output from the various *sayetteries* and other *draperies légères* (*sèches*) was 3.64 million metres, i.e., about 76 percent greater. See Hugo Soly and Alfons Thijs, 'Nijverheid in de zuidelijke Nederlanden', in J.A. Van Houtte, et al., eds., *Algemene geschiedenis der Nederlanden*, 12 vols. (Haarlem, 1977-1979), Vol. 6, pp. 27-57. ¹³ See the sources cited above in n. 7 above.

Low Countries in the decade from the mid 1530s to the mid 1540s, that illustrates the very major differences between ‘every day’ and ‘luxury’ textile consumption.¹⁴ In this table, the first category of textiles, as a ‘necessity’ in terms of meeting fundamental needs for clothing, is represented by two types of the light-weight and relatively cheap worsted-type Hondschoote *says*, which had genuinely international importance. The other two textiles in this table that represent the other, contrasting category of luxury textiles are the Ghent *dickedinnen* woollen broadcloths and the Mechelen *Rooslaken* woollen broadcloths.¹⁵

For no other pre-modern era, in the Low Countries, are we able to make such a valuable comparison. Since the Flemish *sayetteries* regained their economic prominence only in the very late fifteenth, early sixteenth centuries, as noted earlier, we have only a very few, scattered prices for *says* in the medieval era.¹⁶ For luxury woollen broadcloths, Ghent and Mechelen are the only towns, in the southern Low Countries, at least, whose annual treasurers’ accounts continue to provide individual textile prices after 1500.¹⁷ Nevertheless, the prices of woollens from both Ghent and Mechelen, were, in the 1530s, relatively no higher

¹⁴ See the sources cited above in nn. 7 and 10 above.

¹⁵ The Flemish textile term *dickedinnen* literally means ‘thick and thin’. It probably refers to the twilled weave with an alternation of two wefts and then one weft over the warp yarns, giving a slightly ribbed effect. See Guy De Poerck, *La draperie médiévale en Flandre et en Artois: Technique et terminologie*, 3 vols. (Bruges, 1951), vol. III: *Glossaire flamand*, p. 29, no. 118. Such woollens were also manufactured at Bruges, Ypres, and Mechelen. The term *Rooslaken* literally means ‘rose cloth’; but most were black. See below, Tables 2 and 10.

¹⁶ For one example, and perhaps the only published one, see Munro, ‘Resurrection of an Old Flemish Industry’, Table 7, p. 88; and see also ‘Appendix on Says’, pp. 87-93. For prices for roughly comparable English worsteds in the mid fifteenth century, see John Munro, ‘Industrial Protectionism in Medieval Flanders: Urban or National?’ in Harry Miskimin, David Herlihy, and A. L. Udovitch, eds., *The Medieval City* (New Haven and London: Yale University Press, 1977), Table 13.3, pp. 257-63, esp. p. 258.

¹⁷ Stadsarchief Gent, Stadsrekeningen 1314/15-1569/70, Reeks 400:1-77; Stadsarchief Mechelen, Stadsrekeningen 1315-1550, Series I: 3 - 225 (1315 - 1550); Algemeen Rijksarchief, Rekenkamer, registers nos. 41,205 - 41, 285. The other exception is for cloth prices in Leiden (Holland), whose town accounts provide prices from 1391, but regularly only from 1460 to 1570: Gemeente Archief Leiden, Archief der Secretarie van de Stad Leiden, 1253-1575, nos. 511-640 (for cloth prices from 1391-1570). I have not yet had the time and resources, however, to tabulate these data on a spreadsheet.

(in ‘real terms’) than they had been in the fifteenth century.¹⁸ Furthermore, as Table 1 demonstrates, the 1546 drapery ordinance for the Ghent *dickedinnen* indicates that it was exactly the same woollen broadcloth whose production had previously been regulated in 1456; and indeed this ‘medieval broadcloth’ seems to have been manufactured without any significant changes from at least the mid-fourteenth century. The other sixteenth-century broadcloth in Table 2, the Mechelen *Rooslaken*, also seems to have been unaltered since its first appearance in the mid fifteenth century.

To be sure, ‘homespun’ or cottage-produced textiles might better meet the test of representing ‘necessities’; and conversely, woollen scarlets and silk fabrics would be better representations for luxury – or ultra-luxury – consumption. But for none of these do we have comparative market prices in this period. In the first place, homespun textiles by their very nature were not traded in most European markets. Second, scarlets had largely disappeared from northern markets by the mid-fifteenth century.¹⁹ Third, while silks had become even more prominent in European luxury textile markets, by the sixteenth century, we certainly do not have the data to compare prices with product sizes for the very wide variety of silken textiles (satins, damasks, velour, etc), in various and widely differing dimensions.²⁰ We do, however, have such data for both luxury woollen broadcloths and Hondschoote *says*, as presented in both Tables 1 and 2.

The physical composition of woollens and worsteds and the technology of their production.

But before examining these differences in prices and relative values, we must first examine the

¹⁸ For the evidence on relative prices, from a wide variety of late-medieval draperies, see Munro, ‘The Anti-Red Shift’, pp. 55-95, and especially Tables 4.1 (pp. 58-61), Table 4.3 (pp. 68-72); Table 4.4 (p. 74). Table 4.5 (pp. 82-83); Munro, ‘The Medieval Scarlet’, pp. 13-70; esp. Table 3.6, p. 42; Table 3.7, p. 43; Table 3.8, p. 44; Table 3.11, p. 49-50; Table 2.14, pp. 67-68; Munro, ‘Industrial Protectionism’, pp. 229-67, Table 13.3, pp. 257-62; Table 13.5, pp. 266-67; Munro, ‘Resurrection of an Old Flemish Industry’, Tables 1 - 2, pp. 39-44; Munro, ‘Medieval Woollens: Western European Woollen Industries’, Table, 5.10, pp. 318-24. For the forms, nature, and technology of medieval northern broadcloths, see John Munro, ‘Medieval Woollens: Textiles, Textile Technology’, pp. 181-227.

¹⁹ See Munro, ‘The Anti-Red Shift’, pp. 73-77, 84-91 (esp. n. 49).

²⁰ See the sources cited above in n. 6. For prices of some silk fabrics in fifteenth-century England, see Munro, ‘Medieval Scarlet’, Table 3.15, p. 69; and Munro, ‘Industrial Protectionism in Flanders’, Table 13.3, Part I, pp. 257-60.

physical differences between the wool-based textiles grouped into three categories: says or worsteds, woollens, and a hybrid category, commonly called serges.²¹ Says or worsteds, a very ancient textile fabric, historically preceding genuine woollens, were generally the much lower quality, lighter, and least expensive of the three types. They were woven from relatively cheap, coarse, strong, long-stapled 'dry' yarns (20.0 to 30.5 cm), worsted yarns in both warps and wefts; and they were generally woven on a narrow, one-man horizontal treadle-loom, often with a diamond or lozenge twilled weave.

Woollens, on the other hand, were generally much finer quality, much heavier, and more expensive of these three types. The principal reason for their greater weight, better quality, and higher cost (when undyed) was their wool-composition: very fine, curly, short-stapled (5.0 - 6.0 cm) 'greased' or 'wet' yarns, in both warp and weft. In medieval Europe, by far the finest and thus the most costly wools of this type were English: specifically, in order of quality and value, those from the Welsh Marches or western counties of Herefordshire and Shropshire; second, from the adjacent Cotswolds counties of Worcestershire, Gloucestershire, Oxfordshire, and Berkshire; and a more distant third, those from the Kesteven and Lindsey districts of the north-eastern county of Lincolnshire.²²

Harte, ed., *The New Draperies in the Low Countries and England, 1300 - 1800*, Pasold Studies in Textile History no. 10 (Oxford and New York: Oxford University Press, 1997), pp. 7-34. For silks, see nn. 6 and 20 above.

²² See John Munro, 'Wool-Price Schedules and the Qualities of English Wools in the Later Middle Ages, ca. 1270 - 1499', *Textile History*, 9 (1978), 118-69; and 'The 1357 Wool-Price Schedule and the Decline of Yorkshire Wool Values', *Textile History*, 10 (1979), 211-19; both reprinted in John Munro, *Textiles, Towns, and Trade: Essays in the Economic History of Late-Medieval England and the Low Countries*, Variorum Collected Studies series CS 442 (Aldershot, Hampshire; and Brookfield, Vermont: Ashgate Publishing Ltd., 1994). See also Munro, 'Textile Technology', pp. 693-711; Munro, 'Medieval Woollens: Textiles, Textile Technology, and Industrial Organisation', pp. 181-227. By the sixteenth century, however, Spain was producing and exporting some better varieties of *merino* wools, which had now evolved, from their mid fourteenth-century origins, to rival the better English wools in quality; and by the seventeenth century the

The techniques and physical natures of wool-based textile production

The necessary techniques to prepare these fine wools for weaving also explain the much heavier weights of these woollen textiles: i.e., combing (for the warp yarns), carding (for the weft yarns), spinning (drop-spindle for warps and spinning wheels for the wefts), warp-winding on the loom, and weft-insertions in the weaving bobbins; weaving itself (wefts inserted with shuttles through heddle-separated warps); and then fulling the woven cloth. First, these short, curly, scale-fibred wools had to be greased – with butter, olive oil, or herring fat (though generally forbidden) – in order to protect them from entanglement and thus damages in these ensuing processes. That was all the more necessary since the natural oils or lanolin in the wool fibres had been removed in the scouring and cleansing processes of wool preparation.

Worsted wools, on the other hand, did not require any such greasing. First, they were not scoured, and thus retained their own natural lanolin; and, second they were strong and sufficiently straight-stapled that they did not need such protection in the combing, spinning, and weaving processes. For this basic reason, in the medieval and early-modern Low Countries and France, the woollen industries were known as the ‘greased’ (or wet) draperies: *draperies ointes*; or in Flemish (Nederlands), the *gesmoutte draperie* (*lakenindustrie*). Conversely, the worsted industries were known as the ‘dry’ draperies: *draperies sèches*; and, in Flemish, *droge draperie*.

Fulling and finishing woollens

The removal of that grease, and also of the starchy warp-sizing, and dirt adhering to both, explains the first and very necessary reason for the fulling processes that ensued when the woven cloth was removed from the loom. For woollens, it was a two-man treadle-operated broadloom, producing cloths that were up to 4.0 metres in width, and up to 33 metres in length (Table 1). These cloths were then placed in a fuller’s vat, or large earthenware tub, containing an emulsion of warm water, a chemical known as *fuller’s earth*, and

even better *merinos* had surpassed the best English wools in quality (and now also in price). Indeed, the finest wools in the world today are those produced by sheep that are the descendants of the Spanish *merinos*, especially in Australia and New Zealand. See John Munro, ‘Spanish *Merino* Wools and the *Nouvelles Draperies*: an Industrial Transformation in the Late-Medieval Low Countries’, *Economic History Review*, 2nd ser., 58:3 (August 2005), 431-84.

also urine, even though it was widely prohibited. The ammonia in the urine not only enhanced the scouring and bleaching properties of fuller's earth but also combined with the grease to form a cleansing soap.²³ The fullers, usually a pair of husky journeymen, supervised by a master, then vigorously trod upon the soaking cloth, for periods ranging from three to five days, according to the quality of the cloth and the season (since the working day in summer was twelve to fourteen hours, but only eight hours in the winter months).²⁴

But the equally or even more important reason for fulling was two-fold. The first was to force the short, curly, scaly, and weak wool fibres to interlace and interlock and thus to felt, in order to give the cloth cohesion and strength. For otherwise, an unfulled cloth taken from the loom would suffer tearing, possibly to the extent of falling apart. The second and related objective was to shrink and compress the cloth, by as much as one half (54 to 56 percent).²⁵ Both objectives were achieved by the combination of pressure and heat: from foot-pounding and soapy hot water. That compression therefore also fundamentally explains why fulled woollen broadcloths were so much heavier than were worsteds (and also hybrid fabrics). Once fulled in this fashion, woollen broadcloths were virtually indestructible and could be worn by and through several generations, through inheritance or second-hand sales. At the same time, the fulling process obliterated

²³ Fuller's earth, a clay-like substance, is more properly known as *floridin*, whose chief hydrous aluminum silicate was usually kaolinite ($\text{Al}_2\text{O}_3\text{Si}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$). These scouring agents also made the wools more receptive to the dye-fixing mordant, usually alum, when the cloth was subsequently dyed in the piece. See my publications cited in nn. 4, 7, 21-22, and n. 26 below.

²⁴ See sources in nn. 7, 21-22, and 26: especially Munro, 'Industrial Entrepreneurship in the Late-Medieval Low Countries', pp. 377-88.

²⁵ In 1458, the Bruges fullers' ordinance for *bellaert* woollens stipulated that the overall shrinkage from this compression and felting, which gave the cloth its required strength and durability, had to be at least 56 percent (from 172 to 75 square ells): in length, from 43 to 30 ells (30m to 21m); and in width, from 4.0 to 2.5 ells (2.8m to 1.75m). See Octave Delepierre and M. F. Willems, eds., *Collection des keuren ou statuts de tous les métiers de Bruges* (Ghent, 1842). The better known Ghent *dickedinnen*-broadcloths of the fifteenth and sixteenth centuries (1456, 1462, 1546) underwent a very similar shrinkage, of 54 percent (from 75.49m² to 34.91m²). Marc Boone, 'Nieuwe teksten over de Gentse draperie: wolaanvoer, productiewijze en controlepraktijken (ca. 1456 - 1468)', *Bulletin de la commission royale d'histoire [de Belgique]*, 154 (1988), 1 - 61; M.J. Lameere, and H. Simont, et al, eds. *Recueil des ordonnances des Pays Bas*, deuxième série: 1506 - 1700, V (Brussels, 1910), pp. 272-83. In both, and indeed in all such woollens, the width underwent greater shrinkage than the length (37.5 vs 30.2 percent), because the warps were more tightly spun than the wefts.

almost all traces or the designs created by twilled weaving. That was completed by the ensuing processes of cloth-tentering (to remove all wrinkles and defects), teaselling or ‘napping’ (using thistle-like teasels to raise the naps, or loose ends of fibres), and shearing – by a repeated alternating process of napping and shearing – so that the final product was as soft and fine to the touch as silk.

Fulling was the one and only major process of woollen cloth manufacturing that underwent powered mechanization before the modern Industrial Revolution (and really only in the nineteenth century).²⁶ Water-powered fulling mills had been introduced into Italian cloth manufacturing by the tenth century CE, and had become widely diffused in English cloth industries during the thirteenth and fourteenth centuries. That process, using cams and trip-hammers to convert the rotary power of the water wheel into reciprocal power, effected the fulling processes by pounding the cloth with a pair of heavy blocks of oak (about 24 kg in weight), used in alternation, up to 40 times per minute. With just one attendant, these fulling-mills could scour, felt, and full a standard-sized good quality woollen cloth in about twenty hours, though requiring only about nine hours for lesser quality cloths.

The economic significance of this industrial innovation can be seen in comparative production costs: traditional foot-fulling accounted for about twenty percent of the value-added pre-finishing costs (in the medieval Low Countries); but mechanical fulling (as documented in Florence), combined with tentering,

²⁶ For water-power and the following, see Paolo Malanima, ‘The First European Textile Machine,’ *Textile History*, 17 (1986), 115 - 28; Eleanora M. Carus-Wilson, ‘An Industrial Revolution of the Thirteenth Century,’ *Economic History Review*, 1st series 11 (1941), reprinted in her *Medieval Merchant Venturers: Collected Studies* (London, 1954), pp. 183-211; John Munro, ‘Industrial Energy from Water-Mills in the European Economy, 5th to 18th Centuries: the Limitations of Power’, in Simonetta Cavaciocchi, ed., *Economia ed energia, secoli XIII - XVIII*, Atti delle ‘Settimane di Studi’ e altre Convegni, Istituto Internazionale di Storia Economica, ‘Francesco Datini da Prato’, vol. 34 (Florence, Le Monnier: 2003), pp. 245-64; and my other publications cited in nn. 7, 21-22, above, especially Munro, ‘Textile Technology’, pp. 693-711; Munro, ‘Medieval Woollens: Textile Technology’, pp. 181-227; Munro ‘Industrial Entrepreneurship in the Late-Medieval Low Countries’, pp. 377-88. Water-powered fulling mills were first introduced into England in 1173. In the fifteenth century, water-powered gig-mills, designed to displace teasels in raising the nap on woollen cloth, were added to some English fulling mills, but never became widespread before the nineteenth century (for reasons given in my two publications cited in this note).

accounted for only about five percent of such costs.²⁷ Thus, with a potential of a 75 percent savings in the fulling processes, we can readily understand why the English cloth industry had become almost completely converted to this form of mechanized fulling, by the later fourteenth-fifteenth century.

In the southern Low Countries, some draperies had also used fulling-mills during the thirteenth and early fourteenth centuries, but they were not used again in this region until the sixteenth-century. The reason can be found in the previously discussed reorientation of textile manufacturing in the Low Countries to luxury woollen cloth production, certainly from the 1330s. Thus, when the economics of this later-medieval industry dictated a form of price-making monopolistic competition, in which competition was essentially based on the Flemish draperies' success in convincing foreign consumers of the superior quality of their luxury woollens, these draperies feared that mechanical fulling would injure or degrade the finer woollen yarns, and thus ruin their reputation for superior quality. At the same time because the labour component of production costs was so small in the luxury woollen draperies, a potential gain of 75 percent from mechanized fulling would have represented, in 1435, a savings of only 3.23 percent of the sales price of a pair of Leiden's *voirwollen halvelakenen*, at £4 9s 0d *groot* Flemish; and a savings of only 2.73 per cent of that year's price of a Ghent *dickedinnen*, at £7 0s 0d *groot*. Since the finer woollens of the Flemish *drie steden* and other drapery towns in the Low Countries were already three times more expensive than rival English broadcloths (see Table 12a), such a very minimal price reduction from mechanisation would have gained them fewer customers than those lost from concerns about the true luxury quality of their woollens.²⁸

Dying and finishing worsteds and woollens

²⁷ See the sources cited in n. 26, for a comparison of water-powered mechanical fulling in Florence with foot-fulling in Leiden (1438); and also Ephraim Lipson, *The History of the Woollen and Worsted Industries* (London, 1921; reprinted Frank Cass and Co., New York, 1965), Appendix I, p. 258: with an estimate on cloth manufacturing costs, from Matthew Hale, *A Discourse Touching Provisions for the Poor* (London, 1683), p. 23: a table indicating that fulling (milling) and burling cost 12s 0d, or 8.28 % of the total manufacturing cost of £7 5s 0d (including the wool, costing £4 10s 0d: 5.24% of a total cost of £11 15s 0d). A Parliamentary report of 1840 stated that in the years 1781-1796, mechanical fulling (scouring, burling, felting) accounted for 6.45% of total manufacturing costs, excluding the cost of wool (11s 6d in a total of £8 18s 3d). *Ibid*, Appendix II, p. 258. See n. 89 below.

²⁸ See the sources cited in n. 26 above.

In contrast, worsteds underwent no such fulling, napping, or shearing processes, but only bleaching and dyeing. The dyeing of both woollens and worsteds took place in the wools or yarns themselves, especially if woad (not requiring a mordant) had been used to produce a basic blue colour, and then in the piece, often using more woad and then madder (with a mordant, such as alum) to produce a wide variety of colours: deep blues, purples, blacks, browns, greens, etc. Those dyed red, or in red-related colours were normally dyed only in the piece. Needless to say, the finer and more expensive woollens were dyed with more costly dyes: especially the scarlets, dyed with kermes (with or without other dyes), to be discussed later in this study on luxury cloth consumption. Thus, worsteds or worsted-type fabrics were generally so much cheaper than the true, heavy-weight fullled woollens for two reasons: first and foremost, because they contained far cheaper raw materials; and secondly, because their production processes were so much simpler, requiring considerably fewer stages of manufacturing, with considerably less labour.

Comparative production costs of woollens and worsteds: wools and labour

Nevertheless, in relative terms, labour did account for a relatively higher proportion of total manufacturing costs in the worsteds industries. As just indicated, in the analysis of fulling costs, labour accounted for a correspondingly smaller share in the production of luxury woollens, especially those woven entirely from the very best English wools, whose high costs were further augmented, as also noted earlier, by English export taxes, which reached a peak burden in the early fifteenth century.²⁹ Thus for example, in producing a fine woollen black broadcloth at Leuven in 1434, its English wools accounted for 76.2 percent of the pre-finishing manufacturing costs and for 62.5 percent of the total cost, while dyeing and dressing the cloth accounted for 18.0 percent of total costs – most of that in the woad and madder dyes themselves – so that the remaining share of manufacturing costs in labour amounted to only 19.5 percent of total costs.³⁰

²⁹ See nn. 7, 21-22, 26 above.

³⁰ For another example: In the Ypres drapery, the fine Cotswold wool used in producing a black woollen broadcloth in 1500 accounted for 64.2 percent of pre-finishing manufacturing costs and for 52.0 percent of total costs (and indeed the price for Cotswolds wool at Calais corresponds to the costs in the Ypres accounts for 1500, when one adds on transport and marketing costs). In the other manufacturing costs, the finishing process of dyeing and dressing again accounted for 19.2 percent of total costs (17.7 percent in dyes and 1.5

Thus, labour's relatively higher share of total production costs in worsted manufacturing simply reflects the relatively lower costs in wools, dyestuffs, and other materials.

Hybrid woollen-worsted textiles: Flemish says and serges, and 'stuffs' of the English 'New Draperies'

The third type of wool-based textile manufacturing was simply a hybrid of the other two main branches. Its textiles, sometimes called says, serges or 'stuffs', were woven from a long-stapled 'dry' worsted warp and a short-stapled 'greased' woollen weft, though generally of much lower quality wools than those used in the true woollen broadcloth industry. In terms of relative weights and values, they corresponded more to worsted than to woollen manufacturing. For that reason, the hybrid or mixed-fabric *sayetteries* and similar serge-type cloth manufacturing industries were classed as part of the 'light draperies' or *draperies légères* (in Flemish: *lichte draperie*), in the medieval and early-modern Low Countries.

As noted earlier, in thirteenth-century Flanders, and then again from the later fifteenth and through the sixteenth centuries, the most prominent manufacturer of this type of cloth was the Hondschoote *sayetterie*.³¹ When rebels in the Low Countries inaugurated their combined religious and nationalist revolt against Spanish rule in 1568 – commencing the Netherlands' 'Eighty Years War', which ended only with the Peace of Westphalia in 1648 – Spanish armies devastated and soon reconquered Flanders, thereby forcing thousands of Flemish textile artisans into exile: to both Holland and England.

For England itself, a very major economic consequence of that forced emigration and exile was the revival of its ancient worsted industry, to become the so-called 'New Draperies'. These predominantly Flemish exiles indeed chose the heartland of that ancient industry: East Anglia (Norfolk, Suffolk, and parts of Essex). Most of the 'New Draperies' products were hybrid worsted-woollen 'stuffs' or serges, much like

percent in shearing costs); but this time somewhat more extensive and skilful labour in spinning, weaving, fulling, and tentering accounted for 26.2 percent of total production costs. For the data sources, see John Munro, 'Industrial Protectionism in Medieval Flanders: Urban or National?' in Harry Miskimin, David Herlihy, and A. L. Udovitch, eds., *The Medieval City* (New Haven and London: Yale University Press, 1977), Table 13.2, p. 256; and Munro, 'The Medieval Scarlet', Table 3.12, p. 52.

³¹ See Coornaert, *La draperie-sayetterie d'Hondschoote*; Coornaert, 'Draperies rurales, draperies urbaines', pp. 60-96 (both in n. 12, above).

those produced in Hondschoote, probably the key progenitor of the English New Draperies.³² From the 1660s, the output and export of this new English industry's products were exceeding, in both volume and value, the true woollens of what were now called the Old Draperies; and by a very considerable margin by 1700.³³ By that year, overseas sales of worsted and semi-worsted 'stuffs' from the New Draperies had now increased, in absolute and relative terms, to account for 58.8 percent of the total textile exports by value; high-quality broadcloths, accounted for only 25.4 percent; and the cheaper, coarser kerseys, dozens, and other 'narrow' woollens, for the remaining 15.8 percent of these exports.³⁴ Nevertheless England's traditional heavy-weight broadcloth industry continued to be important throughout the seventeenth and eighteenth centuries;³⁵ and entered its final phase of decline only from the mid nineteenth century. Kenneth Ponting,

³² See Van der Wee, 'The Western European Woollen Industries, 1500-1700', pp. 439-58; Munro, 'The Origins of the English 'New Draperies': The Resurrection of an Old Flemish Industry, 1270 - 1570', Leo Noordegraaf, 'The New Draperies in the Northern Netherlands, 1500-1800', B.A. Holderness, 'The Reception and Distribution of the New Draperies in England', and Luc Martin, 'The Rise of the New Draperies in Norwich', all in Negley Harte, ed., *The New Draperies in the Low Countries and England, 1300 - 1800*, Pasold Studies in Textile History no. 10 (Oxford and New York, 1997), pp. 35- 127, 173-95, 217-44, 245-74; J.E. Pilgrim, 'The Rise of the "New Draperies" in Essex', *University of Birmingham Historical Journal*, 7 (1959-60), 36-59; Ursula Priestley, 'The Fabric of Stuffs: the Norwich Textile Industry, c. 1650 - 1750,' *Textile History*, 16:2 (Autumn 1985), 183 - 210; Ursula Priestley, *The Fabric of Stuffs: The Norwich Textile Industry from 1565*, Centre of East Anglian Studies, University of East Anglia (Norwich, 1990); Ursula Priestley, 'The Marketing of Norwich Stuffs, c. 1660 - 1730,' *Textile History*, 22:2 (Autumn 1991), 193 - 210.

³³ In 1640, when wool-based textiles still accounted for almost all of English exports -- 92.3 percent by value -- the woollens of the Old Draperies still exceeded the value of the products of the New Draperies (bays, says, serges, perpetuanas, etc.), but not by much: 48.9 percent for the former vs. 43.3 percent, for the latter. See C. G. A. Clay, *Economic Expansion and Social Change: England, 1500 - 1700*, Vol. II: *Industry, Trade, and Government* (Cambridge and New York, 1984), Table XIII, p. 144.

³⁴ Julia de Lacy Mann, *The Cloth Industry in the West of England from 1640 to 1880* (Oxford, 1971), Appendix I: Table B, p. 309 (total value of £2,818,871, excluding hosiery). See also Clay, *Economic Expansion*, Table XV, p. 146, with slightly different figures, total textile exports worth £3,045,196, as the average of exports in 1699-1701: 41.15% in products of the Old Draperies; 51.96 % in products of the New Draperies, and 5.89% Miscellaneous (stockings, hats, others); Van der Wee, 'Western European Woollen Industries', Table 8.6, p. 457.

³⁵ For the importance of England's 'Spanish medley' broadcloths in Mediterranean trade in the seventeenth century, see Ralph Davis, 'England and the Mediterranean, 1570-1670', in Frederick J. Fisher, ed., *Essays in the Economic and Social History of Tudor and Stuart England: Essays in Honour of R. H. Tawney* (London: University of London Press, 1961), pp. 117-37; John H. Munro, 'South German Silver, European Textiles, and Venetian Trade with the Levant and Ottoman Empire, c. 1370 to c. 1720: A Non-Mercantilist

historian of the West Country broadcloth industry, offered this explanation for its decline:³⁶

It should have been clear to all that the days of the old broadcloth, whether made from British [English] or Spanish wool, were numbered. Men were no longer going to wear the heavy, long, broadcloth coats decorated with embroidery that were so fashionable in the eighteenth century. A lighter-weight cloth was needed ...

Textile products other than traditional broadcloths — those just listed — nevertheless continued to support a steadily declining woollen industry into the twentieth century.³⁷ But virtually all wool-based clothing worn today is worsted or semi-worsted in nature; and even so, according to David Jenkins, one of the leading historians on modern-day textiles, ‘the role of wool in world textiles has declined to what is now a very tiny proportion’ (just 4.9 percent in 1990).³⁸

Table 1: the data on the physical composition and weights of woollens, worsteds, and serges (says)

Let it thus be said with complete clarity, in historical perspective: the heyday of the traditional, heavy-weight woollen broadcloth was the fourteenth, fifteenth, and sixteenth centuries. The nature of the physical differences, and thus differences in production costs and market prices, for the three types of wool-based textiles, in sixteenth-century England and the Low Countries, can now be better understood from the

Approach to the Balance of Payments Problem’, in Simonetta Cavaciocchi, ed., *Relazione economiche tra Europa e mondo islamico, secoli XIII - XVIII*, Atti delle “Settimana di Studi” e altri convegni, no. 38, Istituto Internazionale di Storia Economica “Francesco Datini” (Florence: Le Monnier, 2007), pp. 907-62; Munro, ‘Panni di lana’, pp. 105-41. data given in Table 1. The sizes of the three luxury-quality woollens – from the draperies of Ghent (Flanders), Mechelen (Brabant), and Essex (England) – are roughly comparable in terms of the area, in square metres, of the finished cloths: 34.913 m², for the Ghent five-sealed *dickedinnen* broadcloths; 35.604 m², for the five-sealed *Gulden Aeren* (gold eagle) broadcloth woollens from Mechelen; and 37.095 m², for English ‘short’ broadcloths from Essex. Note that all three of these woollen broadcloths were woven uniquely from very fine, short-stapled English wools.

Somewhat smaller in size, primarily because of its narrower width, was the *Oultreffin* woollen manufactured by the relatively young so-called Flemish ‘nouvelle draperie’ of Armentières, with an area of 29.400 square metres. Its distinguishing feature was its wool composition: two-thirds of which were Spanish *merino* wools and one-third English wools (Cotswolds, Lincolnshire Lindseys, and Berkshires). By the mid-sixteenth century, it must be noted, Spanish *merino* wools were rivalling the better English wools in quality, though they would not surpass them until the seventeenth century.³⁹ The heavy weight of the Armentières *oultreffin* indicates, however, that clearly this was a genuine fulled broadcloth: indeed it was the heaviest of all recorded in this table, with a weight of 820.503 grams per square metre of finished cloth. The next heaviest are the Essex broadcloths, with 782.58 grams per square metre; the Mechelen broadcloths are fairly close, at 746.42 grams per square metre (i.e., 97.7 percent of the latter), while the Ghent *dickedinnen*, for centuries that drapery’s most renowned woollen, was only 677.66 grams per square metre (Bruges pound weight), or 633.77 grams (if the Ghent pound is used).

The lightest textile from the Low Countries was the narrow say from Bergues-St. Winoc, a pure worsted, in both warp and weft, which weighed only 260.352 grams per square metre, just 33.27 percent of the weight of an Essex broadcloth, and 34.06 per cent of the weight of Mechelen’s *Gulden Aeren* broadcloth. But note, however, that the Hondschoote small double-say had a very similar weight: 266.334 grams per square metre. But even lighter was the Essex ‘New Draperies’ say (according to 1579 regulations): its weight of 141.193 grams per square metre was only 18.04 percent of the comparable weight of an Essex broadcloth;

³⁹ See Munro, ‘Spanish *Merino* Wools’, pp. 431-84.

just over half (54.23 percent) of the weight of the aforementioned Bergues-St. Winoc say, and less than half the weight (42.49 percent of 332.307 grams per square metre) of the weight of an Essex single bay, another recent product of the English ‘New Draperies’. The weight of that Essex single bay, on the other hand, was very close to that of the Hondschoote single say, which was (somewhat surprisingly) 340.052 grams per square metre (with a weight of 5.103 kg for the full-sized cloth of 15.006 square metres). It was heavier, per square metre of its area, than the small double Hondschoote say evidently because more wool was compressed into its much narrower width (0.613 metre compared to 1.138 metre for the double say). All three of these fabrics were hybrids: with ‘dry’, long-stapled worsted warps and ‘greased’ short-stapled woollen wefts.

The presentation of textile prices: problems and solutions offered

The remaining 16 tables in this study present textile prices over three centuries, most for the Low Countries but some also for England (Table 12) and for Poland (Table 17). For some textiles, these prices range from as early as the 1330s and to as late as the 1570s. The previously mentioned Revolt of the Netherlands and the Eighty Years War (1568 - 1648) necessarily determined the termination of this study. For all tables, including even Table 12 for England, the prices expressed in terms of the Flemish money-of-account: the *pond groot* of Flanders, consisting of 20 shillings, with 12d (pence) to the shilling, and thus 240d to the pound.

But, as impressive as such of series of consecutive annual prices – a rarity in economic history – may be, commodity prices in themselves are utterly useless to the economic historian, unless they can be compared to those for other commodities and to industrial wages. The central problem afflicting the use of such price data is coinage debasement, its opposite, coinage *reinforcement*, and related monetary changes that brought about cycles of inflation and deflation. Coinage debasement is simply the diminution in the quantity of precious metal – here, silver – represented in the actual silver penny and thus in the penny, shilling, and pound, as moneys-of-account. That was achieved by some combination of reducing the weight of the coin, or its fineness (by adding proportionally more copper alloy), or by both techniques. The consequence was

to increase the potential quantity of silver pennies struck from the mint weight of pure silver. From that act flowed two consequences: very large increases in the prince's mint profits (*seigniorage* revenues), but also inflation (rising prices), so that debasement, universally common from the late thirteenth to late sixteenth centuries, may be seen as a tax imposed on the entire population. *Renforcement* is simply the reverse process: of restoring the quantity of pure silver in the penny, with the common if not inevitable opposite consequence of deflation (falling prices).⁴⁰

Brill, 1970), pp. 152-63; Peter Spufford, *Handbook of Medieval Exchange* (London, 1986), pp. xix - lxiv; Peter Spufford, *Money and*

Of the two methods of coinage manipulation, debasement, always undertaken for fiscal motives, was clearly predominant over all these centuries. Thus, in the two centuries from 1350 to 1550, the quantity of fine silver in the Flemish penny or *groot* (*denier gros*, in French) was reduced, by diminutions in both fineness and weight, from 2.067 grams to 0.474 g – an overall reduction of 77.1 percent; and by 1580, that quantity had fallen to just 0.300 g.⁴¹ Even in England, which had more firmly resisted the temptations to engage in debasement than did its continental neighbours, the silver penny lost 44.77 percent of its fine silver contents during the later Middle Ages : from 1.157 g. in 1346 to 0.639 g. in 1526. Subsequently, during Henry VIII's 'Great Debasement', from 1542 to 1551, the penny (and pound sterling) lost a further 83.1 percent of fine silver contents (only partially restored by Elizabeth I's coinage reform of 1560).⁴²

In the meantime, from about 1515 to about the 1640s, another powerful force further reduced the 'real' or exchange value of the silver coinage: the onset of the inflationary European Price Revolution. Its monetary roots lay, first, in the South-German silver-copper mining boom, from the 1460s to the 1540s, and then, from the 1550s, in the growing influx of silver from the newly developed Spanish American mines (in Potosi and Zacatecas), whose influxes began to diminish from the early seventeenth century.⁴³

Its Use in Medieval Europe (Cambridge, 1988).

Victor Morgan (Oxford, 1963), chapter 3, 'The Great Debasement', pp. 46-75; chapter 4, 'Restoration and Reform', pp. 76-98.

⁴³ See John Munro, 'The Central European Mining Boom, Mint Outputs, and Prices in the Low Countries and England, 1450 - 1550', in Eddy H.G. Van Cauwenberghe, ed., *Money, Coins, and Commerce: Essays in the Monetary History of Asia and Europe (From Antiquity to Modern Times)*, Studies in Social and Economic History (Leuven: Leuven University Press, 1991), pp. 119 - 83; John Munro, 'Patterns of Trade, Money, and Credit', in James Tracy, Thomas Brady Jr., and Heiko Oberman, eds., *Handbook of European History in the Later Middle Ages, Renaissance and Reformation, 1400 - 1600*, 2 vols. (Leiden: E.J. Brill,

Most economic historians have sought to obviate this problem of inflationary and deflationary price fluctuations by presenting prices in terms of the pure silver contents of the relevant money-of-account prices for the time and place concerned: the so-called ‘silver equivalents’. This has not been undertaken in this study simply because the methodology involved is so flawed that the results are generally spurious in representing any true or ‘real values’.⁴⁴

In the first place, the underlying assumption of this ‘silver equivalents’ model is that price changes are directly related and directly proportional to the extent of a coinage debasement. That in turn is wrongly assumed to have produced a proportional change in money supplies, which in turn supposedly produced a directly proportional change in consumer prices.⁴⁵ At best, this is a crude and entirely misleading representation of the Quantity Theory of Money; and in terms of the historical evidence, it is simply, unequivocally false. My own regression analyses of changes in the silver contents of Flemish coinages and in commodity price indexes during the fifteenth century never demonstrate any such direct relationships. Indeed, according to my regression analyses, price increases were generally much less than would have been expected from a coinage debasement, whether by diminishing the fineness or the weight of the coins (or both

1994-95), Vol. I: *Structures and Assertions* (1994), pp. 147-95; John Munro, ‘The Monetary Origins of the “Price Revolution:” South German Silver Mining, Merchant-Banking, and Venetian Commerce, 1470-1540’, in Dennis Flynn, Arturo Giráldez, and Richard von Glahn, eds., *Global Connections and Monetary History, 1470 - 1800* (Aldershot and Brookfield, Vt: Ashgate Publishing, 2003), pp. 1-34; John Munro, ‘Price Revolution’, in Steven N. Durlauf and Lawrence E. Blume, eds., *The New Palgrave Dictionary of Economics*, 2nd edition, 6 vols. (London and New York: Palgrave Macmillan, 2008), vol. 6, pp. 631-34.

⁴⁴ For a very cogent criticism of the use of ‘silver prices’ in economic history, see Van der Wee, *Antwerp Market*, Vol. I, pp. 115-22: ‘The problem of gold and silver equivalents’. My arguments, while endorsing Van der Wee’s fully, concern other related issues. See also on this same theme: Jean Meuvret, ‘Les prix des grains à Paris au XV^{me} siècle et les origines de la mercuriale: Paris et Ile-de-France’, *Mémoires publiés par la fédération des sociétés historiques et archéologiques de Paris et de l’Ile-de-France*, 11 (1960), 283-311.

⁴⁵ Furthermore, most historians fail to recognize the reciprocal relationship between a debasement – reducing the silver contents of the coin – and the inflationary increase in the money supply. The actual formula is for the increase in the coined value of silver from a debasement is: $(1/1 - x) - 1$, where x = the percentage reduction in the silver content of the money of account. Thus a 10.00% reduction in the fine silver contents will lead to a 11.11% increase in the number of pennies coined from the mint weight of fine silver. See Munro, ‘Money, Prices, Wages’, pp. 16-18, 40-44; Munro, ‘Deflation and the Petty Coinage Problem’, pp. 388-403, 417-18.

together), and thus by increasing the supply of coins in circulation. Second, this technique also fallaciously assumes that the real value of silver is constant over the centuries, while in fact its purchasing power in terms of both gold and goods fell: from a bimetallic ratio of 9.5:1 in the 1360s to one of 14.49:1 in the 1660s.⁴⁶

Alternative methods of obviating the problem of nominal prices in eras of often dramatic price fluctuations and thus of presenting ‘real values’ are presented in the following section, on Table 2.

Table 2: Comparative prices and values of woollens and says in Antwerp in the 1530s

With this information on the physical compositions, sizes, and weights of these textiles, and on the problems of using nominal money-of-account prices and values, we may now better understand the data on textile prices presented in Table 2, for the decade 1535 - 1544. These years were chosen because, as indicated earlier, they are the only ones for which I have found prices for the three textiles whose real values are analysed here: the aforesaid Hondschoote says, the Ghent *dickedinnen*, and the Mechelen *rooslaken* woollen broadcloths (but none, unfortunately, for the Armentières *Oultreffin* broadcloths). Indeed, for the Hondschoote says, the available prices run, for consecutive years, from only 1538 to 1544. The textile prices — and indeed all prices and wages in this study for the Low Countries — are given in the Flemish *groot* money-of-account, in which one pound (livre, pond) = 20 shillings (sous, sols, shillings) = 240 pence (deniers, penningen).⁴⁷

Prices and wages by themselves are useful for the economic historian only when the historical problems of using nominal prices can be obviated, for the reasons just discussed, but also when they can be directly related to the values of other commodities. Three such methods are offered here, in order to estimate ‘real’ values of all the textiles considered in this study: (1) by calculating the number of days’ wages that a master mason would have been required to spend to acquire one or a specified unit of the textiles being

⁴⁶ See my publications in nn. 40-43 above, for an elaboration of these analyses. For bimetallic ratios, See in particular Munro, ‘South German Silver, European Textiles, and Venetian Trade’, pp. 924-28, 952.

⁴⁷ Although the wages and some of the prices were actually presented in the Brabant *groot* money-of-account, they were readily converted into Flemish money by dividing the Brabant wages and prices by 1.5 (the fixed ratio of the two currencies from 1435 to 1790). See Van der Wee, in n. 41 above, n. 54 below.

considered; (2) by using comparative price indexes: i.e., comparing a Consumer Price Index based on a 'basket of consumables' for such masons or other industrial workers with a similar price index for the textile concerned, all with a common base period; and (3) by estimating the number of such 'baskets of consumables' whose aggregate value equalled the market value of the textile being considered.

Textile Values in relation to the purchasing power of a building craftsmen's daily money wage

The first question posed is to ask how much a master building craftsmen would have had to spend to acquire one or a specified unit of these textiles. There are three reasons for choosing the wages of a master mason. First, masons, carpenters, and other building craftsmen were members of about the only occupation for which we possess a continuous series of time-rate (daily) wages for both the Low Countries and England, from the later medieval to modern eras. For, during this era, most wage-earners earned piece-work wages (i.e., payment for the quantity of work produced); and thus the purchasing power of such wages is almost impossible to calculate. Second, wages for masons and carpenters, especially the former, are by far the most prevalent and consistently continuous throughout this entire era; and, it must be noted, only those wages not combined with payments in food, drink, or other kind, were used. Third, masonry (brick and stone) was an occupation that was basically unchanged in its technology and productivity up to the late nineteenth century, thus permitting us to make reasonable comparisons of nominal and real wages over these centuries.

Columns 7 - 10 indicate the number of days' wages that a master mason in Antwerp would have had to spend in purchasing one each of the following textiles: a Hondschoote single say, a Hondschoote double say, a Ghent *dickedinnen* broadcloth, and a Mechelen *rooslaken* broadcloth. Thus, in summary, on average in the years 1538 to 1544, an Antwerp master mason would have correspondingly spent 17.163 days' wages to purchase a Hondschoote single say (15.01 square metres); 39.382 days' wages (over twice as many) for a Hondschoote double say (27.869 square metres); but 265.954 days' wages to purchase a Ghent *dickedinnen* broadcloth (34.913 square metres); and somewhat less, 219.987 days' wages to purchase a Mechelen *rooslaken* broadcloth (35.604 square metres).

Since, however, the dimensions of these four textiles varied from each other, and thus varied in the

amount of men's clothing that were produced from them, we instead ask how many days' wages that master mason would have spent to acquire 12 square metres of each, about the amount requisite to produce one suit of men's clothing (about three per broadcloth).⁴⁸ Those estimates, for each of these three textiles, are produced in columns nos. 11 - 14. For this period, the average number of days' wages required to purchase that same quantity of cloth (12 square metres) would have been: 13.725 days for a Hondschoote single say; 16.958 days for a Hondschoote double say; and 5.4 times as many days, 91.413 for a Ghent *dickedinnen* and 74.144 days for a Mechelen *rooslaken*.

Certainly this comparison provides a very vivid contrast between the consumption of 'every day' textiles and luxury woollens. Consider again, from Table 2, that the number of days' wages that a master mason would have had to spend in acquiring a single Ghent *dickedinnen* varied from a high of 348.31 days' wages to a low of 240.00, in the ten year period from 1535 to 1544; and the mean for the years 1538 to 1554 was (again) 265.954 days' wages. Consider, furthermore, that the average number of days employment for master mason in the Antwerp region was about 210 days – so that this range went from 1.66 years to 1.14 years of employment.⁴⁹ In terms of perhaps the more useful comparative measure, the number of days' wages need to purchase 12 square metres of woollen cloth, that number varied from a high of 119.718 days to a low of 79.055 days, with the aforesaid mean of 91.413 days (for 1538-44).

We may reasonably expect that the principal market for these exceptionably costly luxury

⁴⁸ The Mechelen *stadsrekeningen* accounts for cloth purchases (see Table 10) indicate that three men's suits were made from each *rooslaken* broadcloth, i.e., about ten Flemish ells (1 ell = 0.700 metre); Van Uytven, 'Cloth in Medieval Literature', p. 151, states that a complete outfit – 'a surcoat, a coat, a hood and a pair of trousers' – required about 15 ells (10.50 metres).

⁴⁹ For the estimate of 210 days annual employment, see Van der Wee, *Growth of the Antwerp Market*, Vol. I: *Statistics*, Appendix II: Wages, pp. 457-60, and Appendix 48, pp. 540-44; John Munro, 'Builders' Wages in Southern England and the Southern Low Countries, 1346 -1500: A Comparative Study of Trends in and Levels of Real Incomes', in Simonetta Caviacocchi, ed., *L'Edilizia prima della rivoluzione industriale, secc. XIII-XVIII*, Atti delle "Settimana di Studi" e altri convegni, no. 36, Istituto Internazionale di Storia Economica "Francesco Datini" (Florence: Le Monnier, 2005), pp. 1013-76, esp. pp. 1028-31; John Munro, 'Urban Wage Structures in Late-Medieval England and the Low Countries: Work-Time and Seasonal Wages', in Ian Blanchard, ed., *Labour and Leisure in Historical Perspective, Thirteenth to Twentieth Centuries*, Vierteljahrschrift für Sozial- und Wirtschaftsgeschichte Beiheft series, no. 116 (Stuttgart: Franz Steiner Verlag, 1994), pp. 65-78.

dickedinnen were the aristocracy and very wealthy bourgeoisie – not master building craftsman (let alone their journeymen). The number of days' wages to purchase the Hondschoote says, whether single or double – a mean of 17.163 days for the single and a mean of 39.382 days for the double – is seemingly much more in line with more modern expenditure patterns on clothing, for the lower middle classes. Thus this table certainly provides the a very effective contrast between the purchases of necessities and of luxuries, at least for this era.⁵⁰

Price Indexes and the 'Basket of Consumables' (England, Brabant, Flanders) in measuring textile values

We now turn to a different measure of comparison of textile values, with perhaps limited use for this period (1538-44), but of very great value in comparing the 'real' value of such textiles over the three centuries of this study: a Consumer Price Index based on the money value of a weighted 'basket of consumables'. Column 15 provides the aggregate value of the various commodities, in Flemish pence *groot*, contained in the Brabant 'basket of consumables', which Prof. Herman Van der Wee constructed on the model of the famous Phelps Brown and Hopkins 'basket of consumables'.⁵¹

⁵⁰ But that assumption will be challenged in the conclusions to this study, on pp. 000-00.

⁵¹ See Table 18 below. For England, see E. Henry Phelps Brown and Sheila V. Hopkins, 'Seven Centuries of the Prices of Consumables Compared with Builders' Wage-Rates,' *Economica*, 23:92 (November 1956), 296-314; reprinted in E.M. Carus-Wilson, ed., *Essays in Economic History*, 3 vols. (London, 1954-62), vol. II, pp. 179-96, and also in E.H. Phelps Brown and Sheila V. Hopkins, *A Perspective of Wages and Prices* (London, 1981), pp. 13-59, containing tables not presented in their earlier publications. I have recalculated their entire price index, from 1264 to 1700 from: Archives of the British Library of Political and Economic Science (London), Phelps Brown Papers Collection, Box Ia.324. For Brabant, see Herman Van der Wee, 'Prijzen en lonen als ontwikkelingsvariabelen: Een vergelijkend onderzoek tussen Engeland en de Zuidelijke Nederlanden, 1400-1700,' in *Album aangeboden aan Charles Verlinden ter gelegenheid van zijn dertig jaar professoraat* (Gent, 1975), 413-47; reissued in English translation (but without the tables) as 'Prices and Wages as Development Variables: A Comparison Between England and the Southern Netherlands, 1400-1700,' *Acta Historiae Neerlandicae*, 10 (1978), 58-78; and reprinted in Herman Van der Wee, *The Low Countries in the Early Modern World* (1992), 223-41. I have presented my own versions of these two price indexes, as used in this current study. For Flanders, see Flemish price index, in John H. Munro, 'Wage Stickiness, Monetary Changes, and Real Incomes in Late-Medieval England and the Low Countries, 1300 - 1500: Did Money Matter?' *Research in Economic History*, 21 (2003), Table 1, p. 231; and a fuller version in Munro, John H., 'Builders' Wages in Southern England and the Southern Low Countries, 1346 -1500: A Comparative Study of Trends in and Levels of Real Incomes', in Simonetta Caviacocchi, ed., *L'Edilizia prima della rivoluzione industriale, secc. XIII-XVIII*, Atti delle "Settimana di Studi" e altri convegni, no. 36, Istituto Internazionale di Storia Economica "Francesco Datini" (Florence:

The Phelps Brown & Hopkins index for southern England has been widely used by economic historians in presenting English price trends, in terms price-index numbers from the thirteenth to twentieth centuries (specifically: 1264-1954). It is the only readily available and the only reasonably-weighted price index available, so that it would have been foolish to seek any other model.⁵² Both the Phelps Brown & Hopkins and the Van der Wee indexes, along with my own Flemish commodity price-index, use a common base: 1451 - 75= 100.⁵³ Since my Flemish price index ends in 1500, the Van der Wee Brabant price index has been used for Flemish textile values after that year, on the grounds that by then the two economies, having undergone monetary unification in 1433-35, were sufficiently well integrated, within a relatively small

Le Monnier, 2005), Table 1, pp. 1048-50.

⁵² Other alternative indexes are to be found in: Robert Allen, 'The Great Divergence in European Wages and Prices from the Middle Ages to the First World War', *Explorations in Economic History*, 38:4 (October 2001), 411-47; Gregory Clark, 'Work, Wages and Living Conditions: Building Workers in England from Magna Carta to Tony Blair', in Simonetta Caviococchi, ed., *L'Edilizia prima della rivoluzione industriale, secc. XIII-XVIII*, Atti delle "Settimana di Studi" e altri convegni, no. 36, Istituto Internazionale di Storia Economica "Francesco Datini" (Florence, 2005), pp. 889-932. Gregory Clark, 'The Long March of History: Farm Wages, Population, and Economic Growth: England, 1209-1869', *The Economic History Review*, 2nd ser., 60:1 (February 2007), 97-135. In another study, I have explained why I cannot use such price-indexes, apart from their reliance on 'silver equivalents': see Munro, 'Builders' Wages in Southern England and the Southern Low Countries, 1346 -1500', pp. 1013-31.

⁵³ The Van der Wee Brabant consumer price index (1400-1700), contains ten commodities: wheat (126.0 litres), barley-malt (162.0 litres), beef (23.5 kg), herring (40 in number), butter (4.8 kg), cheese (4.7 kg), charcoal (162.0 litres), candles (1.333 kg), linen cloth (1.800 metres), and low-grade coarse woollens (1.125 metres). Grains (rye and barley) account for 18.24 % of the basket by value; drink (barley malt), for 17.08 %; meat (beef), for 23.53 %; fish (herring), for 4.30 %; butter and cheese together, for 11.05%; fuel and light (charcoal and candles), for 7.82 %; and textiles (linen and coarse woollens), for 18.00 %. The Phelps Brown & Hopkins index contains 16 commodities: wheat (45.461 l); rye (36.369 l); barley (18.184 l); peas (24.243 l); barley-malt (163.659 l); pigs (0.500); sheep (0.500); beef (14.696 kg); herrings (40 in number); butter (4.536 kg); cheese (4.536 kg); charcoal (154.567 l); candles (1.247 kg); lamp oil (0.284 l); linen (0.610 m); shirting (0.457 m); coarse woollens (0.304 m). Farinaceous products account for 20.00% of the basket; drink (malt), for 22.50%; meat, for 21.00%; fish, for 4.00%; fuels, for 7.50%; and textiles, for 12.50%. While the Phelps Brown & Hopkins and the Van der Wee commodity price index cover the entire period of this study, my Flemish price index covers only the years 1350-1500. My Flemish price index (1350-1500) contains eight commodities: wheat (45.461 l.), rye (36.369 l), barley (18.184 l), peas (24.243 l); barley-malt (163.659 l); butter (13.610 kg); cheese (13.610 kg); and coarse woollens (1.225 metres). The farinaceous (grain) products account for 24.19 % of the basket; drink (barley-malt), for 20.43%; butter and cheese, for 35.37 %; and textiles, for 20.01 %. See n. 51 above. I have presented, online, an Excel file with a quantitative analysis of these three indexes, with the values of each commodity in the local money-of-account, in: <http://www.economics.utoronto.ca/munro5/ClothPriceExplan.htm>.

geographic era, to permit its use for this purpose.⁵⁴

These ‘baskets’ do not, however, represent any fixed requirement for annual consumption in either southern England, Flanders, or southern Brabant; instead, according to Phelps Brown and Hopkins, their model basket represents ‘what a hundred pence [sterling] would buy in 1451-75’.⁵⁵ In other publications I have analysed in much greater depth the validity of these two ‘consumer baskets’ in terms of the known household expenditures in the fifteenth and sixteenth centuries, and the statistical methods employed in their construction, Both considerations have convinced me that the Van der Wee basket (even with fewer commodities) provides a better reflection of changing consumer expenditure patterns in these two centuries, than does the Phelps Brown & Hopkins index, particularly in registering changes in those consumer patterns in response to changes in the relative prices of these commodities, though neither of the baskets can take true account of consumer substitutions with such changes in relative prices.⁵⁶ I have, therefore, modelled my own Flemish ‘basket of consumables’ price index on the Van der Wee rather than on the Phelps Brown & Hopkins index for England. Whatever the historical defects of these statistical ‘consumer baskets’ clearly they provide a far preferable measure of comparative consumption values than would, say, the use of just wheat prices, ‘for man lives not by bread alone’.

Economists commonly used such Consumer Price Indexes in order to ‘deflate’ or to ‘discount’ particular commodity price and wage series, i.e., to take account of the effects of inflation or deflation. If the ‘nominal’ or money-of-account price or ‘nominal’ money wage indexes are divided by the Consumer Price Index, all having a common base period, the calculated result is known as the ‘real’ price or the ‘real wage’, expressed as an index number. For this study, all of the price and wage indexes have the common base

⁵⁴ See Munro, *Wool, Cloth and Gold*, pp. 100-103; Spufford, *Monetary Problems*, pp. 152-63; Van der Wee, *Antwerp Market*, Vol. I, Tables XIII - XV, pp. 123-29.

⁵⁵ See n. 51 above. This observation was a careless after-thought on their part. I have calculated that the actual mean value of their ‘basket of consumables’ for the base period 1451-75 was, instead, 112.08d sterling (9.340 shillings). See n. 80 below.

⁵⁶ See Munro, ‘Builders’ Wages in Southern England and the Southern Low Countries, 1346-1500’, pp. 1013-76.

period of the years 1451-1475 = 100.⁵⁷ The real wage therefore represents the purchasing power of the nominal or money wage (in coin), in terms of some defined basket of commodities, or in our modern era, goods and services, which, of course, includes textiles.

In this current study, I have utilized the same technique or principle to provide two other better estimates of the ‘real’ values of these Flemish, Brabantine, and English textiles over these three centuries, with two related measures. The first is to compare the values of these textiles in terms their nominal prices (money-of-account values: in pence *groot* Flemish and English sterling pence) with the money-of-account values of three ‘baskets of consumables’: i.e., the Flemish, Brabantine, and English. Thus I calculated the money-price index for each of the textiles, using the common base of 1451-75; and, dividing that textile-price index by the Consumer Price Index, I thus produced a ‘real price’ index for each textile. This technique is not, however, employed in Table 2, lest it make the table even more difficult to comprehend; but it is employed in the ensuring tables on textile values.

The second, and entirely new method, is to compute the number of comparable baskets of consumables that maser masons could have purchased with their annual money wage-income (in silver coin), for a standard work-year of 210 days: in southern England, Flanders, and Brabant (Antwerp and Mechelen).⁵⁸ Thus the final four columns of Table 2, nos. 16 to 19, calculate the equivalent value of each of these four textiles in terms of the number of these Brabantine ‘baskets of consumables’, i.e., the number of such consumer baskets whose aggregate value, in Flemish pounds *groot*, equals the value of just one of each of these textiles. Thus, for the period 1538 to 1544, the mean values of these four textiles, expressed as their value or worth in numbers of the Brabant ‘baskets of consumables’ are, as follows: for Hondschoote single

⁵⁷ More explicitly, the formula for calculating real wages is: $RWI = NWI/CPI$: i.e., the Real Wage Index equals the Nominal (Money) Wage Index divided by the Consumer Price Index. That is: the average of the prices and of the wages, both nominal and real, for the 25-year period 1451 to 1475 are used as the common denominators, so that the means (averages) = 100.00. An index number of, say, 125 for either the ‘real wage’ or the ‘real price’ of a textile means that the nominal wage or price is 25% higher than that of the mean price or wage for the base period, 1451-75=100.

⁵⁸ See Van der Wee, and other sources cited, in n. 49 above.

says, 0.689 basket; for Hondschoote double says, 1.580 baskets; for Ghent *dickedinnen* broadcloths, 10.685 baskets; and for Mechelen *rooslaken* broadcloths 8.804 baskets. Obviously this measure of comparison does not differ in any real terms from the alternative measure, i.e., the purchasing power of wages, in demonstrating the great gulf between the values of says and luxury woollen broadcloths.

Finally, those using these statistical tables in this study may be puzzled by the use of the harmonic mean, instead of the standard arithmetic mean (average). In Table 2, the harmonic mean was used for columns 7 - 14, and 16 - 19: i.e., in measuring the quantity of the four textiles in terms of the purchasing power of a mason's daily wage and the mean values of these textiles in terms the number of such baskets whose aggregate value equalled the value of the textile concerned.⁵⁹ To quote one statistical authority on this issue: the harmonic mean is 'a calculated average computed by finding the reciprocal of the arithmetic mean of the reciprocals of the numbers to be averaged'; and 'in economic computation the harmonic mean is used in averaging such data as time rates and rate-per-dollar prices' – or here, rate per daily wage or value of the consumer basket. The harmonic mean is always slightly less (by varying amounts) than the corresponding arithmetic mean; but it is the only method that provides consistently valid results (i.e., arithmetic means do not do so).⁶⁰

An examination of the textile prices: their archival sources and validity in this survey

Since, however, Table 2 covers such a short period of time – just one decade in the sixteenth century – we need a far broader perspective, over a far longer period of time, to be reassured that woollens of this type continuously ranked as luxury or ultra-luxury objects of consumption in later-medieval and early-modern

⁵⁹ The intervening column 15 is the arithmetic mean value of the 'basket of consumables' for this period.

⁶⁰ See Harold Sloan and Arnold Zurcher, *A Dictionary of Economics*, 3rd edn (New York, 1953), pp. 149-50; and also F.C. Mills, *Introduction to Statistics* (New York, 1956), pp. 108-12, 401. The mathematical equation is: $HM = 1 / [\sum (1/r_1 + 1/r_2 + 1/r_3 + \dots 1/r_n)] / N$, where r is the value and N is the number of years in the series averaged. It can also be used in index numbers for, say, real wages: the purchasing power of the nominal, money wage = Nominal Money Wage Index divided by the Consumer Price Index. If five-year means of real wages were calculated for the base period of this index – i.e., 1451-75 = 100, then the mean value as the average of the five 5-year periods in this base period would equal exactly 100.00 only if the harmonic mean is used.

Europe. Such evidence to demonstrate the real values of luxury woollens in both the southern Low Countries and England, from the mid fourteenth to mid sixteenth centuries, can be found in the next and final set of statistical tables, nos. 3 to 16, for the late-medieval Low Countries and England. (Table 17 presents prices for a variety of European textiles in Polish markets, ca. 1400; and Table 18 provides the ‘basket of consumable’s price indexes for England, Brabant, and Flanders).

The cloth prices for Flanders and Brabant are those recorded in the annual civic treasurers’ account (*stadsrekeningen*) – for Bruges, Ghent, and Mechelen. The prices recorded, often containing as well the actual costs of dyeing, shearing, and finishing these woollens, cover a very wide range: for the purchase of the finest woollens for the mayor and aldermen (*schepenen*) down to fairly cheap and coarse woollens for policemen, the town musicians, and servants of various town officials; but the prices for the cheaper woollens are not presented in this study.⁶¹ An inter-urban comparison of these textile prices with prices of textiles sold on other markets – when many of the same types of textile were purchased by several towns – provides convincing evidence that these are genuine market prices, and not notional prices.

For late-medieval England, the most consecutive list of cloth prices are those taken from similar cloth purchases at Oxford and Cambridge colleges, as published both by James E. Thorold Rogers and Lord William Beveridge; and I have extracted other English cloth prices (when exported) from the Customs Accounts in the National Archives (formerly the Public Record Office).⁶²

The ensuing Tables 3 - 16 on cloth prices: a descriptive summary of their contents and meanings

Table 3 provides prices for Ghent woollens that were purchased for the civic aldermen, evidently for ceremonial purposes, for the period 1331-5 to 1556-70, in quinquennial means. There are two basic types

⁶¹ Such table (for Ghent in the 1360s) has been presented in John Munro, ‘Hanseatic Commerce in Textiles from the Low Countries and England during the Later Middle Ages: Changing Trends in Textiles, Markets, Prices, and Values, 1290 - 1570’, in Marie-Luise Heckmann and Jens Röhrkasten, eds., *Von Nowgorod bis London: Studien zu Handel, Wirtschaft und Gesellschaft im mittelalterlichen Europa: Festschrift für Stuart Jenks zum 60. Geburtstag*, Nova Mediaevalia. Quellen und Studien zum europäischen Mittelalter (Göttingen: Vandenhoeck & Ruprecht, 2008).

⁶² See the sources for Tables 13 below (also the sources for Tables 11-12).

of Ghent woollens in this table: the aforementioned *dickedinnen* broad cloths and *strijpte laken* (striped or ray cloths, with different colours for warps and wefts). The purchase prices for both textiles are for those woollens that the aldermen wore, for ceremonial occasions, in Ghent itself and at the annual Tournai Festival for the Virgin Mary. The prices are expressed in both current silver-based pounds *groot* (£) Flemish and index-number values, with the base used throughout this study: the mean of values for 1451-75 = 100.

An obvious method of presenting the ‘real’ values of the Ghent *dickedinnen* broadcloths over this entire period, the almost two and half centuries from 1331 to 1570, is a ‘real-price’ index by the method previously discussed.⁶³ Thus, if the nominal price of these textiles rose (in Flemish pounds *groot*) higher than did the value of the Flemish Commodity Price index, then the Real Price Index rose; if, on the other hand, the Flemish Commodity Price index rose higher than did the *dickedinnen* cloth-price index, then the Real Price Index had fallen.

For reasons explained earlier, the Van der Wee Commodity Price Index for Brabant (Antwerp-Lier-Brussels region) has been used to supplement this real-price series from 1500 to 1570.⁶⁴ Unlike Table 2, these Tables 3 - 16 present the cloth prices and values not in annual but in quinquennial (five-year) means. For both of the Ghent cloth prices and for both of the commodity price indexes, the mean index numbers are arithmetic means; but the mean ‘real’ cloth price index numbers are calculated by using the harmonic mean, for the same reasons provided earlier in this study (see Table 2). As is also readily seen in Table 3a, the

⁶³ See above, pp. 000. Here, the current prices of the Ghent *dickedinnen* broadcloths, as purchased for the aldermen (*schepenen*) and burgermasters of Ghent, each year, are summed for the base period 1451 to 1475; and that sum is divided by 25 (the number of years) to provide the mean value of £7.91244 *groot* Flemish for this base period. Next, all the cloth prices, from 1331 to 1570, are divided and that value and multiplied by 100 to obtain the index number value for each year. Thus, all of the annual index numbers represent a percentage of the mean value of these textiles in the base period 1451-75. Those index numbers for the Ghent *dickedinnen* cloth prices are then divided, each year, by the Flemish Commodity Price Index value for each year (with the same base 1451-75 = 100), to obtain the ‘real’ value index number for these cloths for each year. As an equation: $RCVI = DPI/CPI$: the Real Cloth Value Index equals the *Dickedinnen* cloth price index (in terms of price in Flemish pounds *groot*) divided by the Flemish Commodity Price Index, whose mean value for the base period 1451-75 = 126.295d *groot* Flemish. For the construction of the Flemish Commodity Price Index, see n. 51, above.

⁶⁴ See nn. 51, 54, above.

nominal price index for the Ghent *dickedinnen* broadcloths peaked at 213.767 – i.e., 113.767 per cent higher than the mean for 1451-75 – in the quinquennium 1486-90, but the ‘real’ price index peaked at 184.894 in 1496-1500, and remained high in the first decade of the sixteenth century (155.589 in 1506-10), before declining to reach a nadir of 83.807 in 1541-45. This index number indicates that, after the onset of the inflationary Price Revolution, commodity prices in general were rising faster than were the Ghent *dickedinnen* cloth prices. By the last quinquennium, 1566-70, however, the Ghent Real Cloth Price Index had risen to 111.180 (i.e., 11.18 percent higher than the base period of 1451-75).

Table 4 provides these same Ghent woollen prices, comparing the price index for *dickedinnen* with the Flemish and Brabantine composite price indexes (i.e., the ‘baskets of consumables’); and it also compares these cloth values with the money-of-account values of the annual ‘basket of consumables’ (in Flemish pence *groot*). Table 5 continues with this same set of Ghent cloth price series in terms of the purchasing power of industrial craftsmen’s daily wages: i.e., by indicating the number of days’ wages that a master mason in Bruges and Ghent would have spent in acquiring one of each of these textiles, from 1356-60 to 1496-1500 (i.e. in quinquennial means). Table 6 does the same in calculating the number of days’ wages that an Antwerp master mason would have spent in acquiring each of these textiles, from 1401-05 to 1566-70.

In sum, Tables 4 - 6 present the prices, in pounds groot Flemish, and the values of the Ghent *dickedinnen* broadcloths for a remarkable span in the course of three centuries: or, more precisely, for 235 years, from 1336 to 1570. One is thus inclined to ask whether or not the ‘real’ value of these textiles experienced any sustained increase over this long period: i.e., did their relative value rise, in terms of both the number of days’ wages that a master mason would have had to spend to acquire one of these, and in terms of the number of commodity baskets that equalled their value, as expressed in the pound groot money-of-account? While the Flemish data end in the late fifteenth century (wages in 1486, prices in 1500), the wage and price data for Brabant, and especially the Antwerp region, though available only from 1400, do continue to the end of the Ghent cloth price series, in 1570. In general, as the tables indicate, the purchasing power

of mason's wages in Antwerp was generally lower than in Bruges for most of the fifteenth century.⁶⁵

For Flanders, we may observe that the value of a Ghent *dickedinnen* varied from a low of 8.088 Flemish commodity baskets in 1371-75 to an abnormal high of 27.801 Flemish baskets in the final quinquennium of 1496-1500, when, with the end of the civil-war (and of coinage debasements), commodity prices suddenly fell, while textile prices, having risen sharply, remained stable, and very high (as noted earlier). When the value of these Ghent woollens are measured in terms of the purchasing power of a master mason's daily wage (Table 5), we find that such a value ranged from a low of 131.89 days' wages in 1346-50 to a fourteenth-century high of 204.55 days' wages in 1381-85, then falling to a low of 139.90 days' wages in 1406-10, and then reaching a new high of 237.07 days' wages in 1481-85 (after which, as just noted, the Bruges wage data cease). In general, the relative value of the Ghent woollens was considerably higher in the second half of the fifteenth century than before, principally because English fiscal and commercial policies – which I have analysed elsewhere – had led to a severe increase in wool-export prices and thus in the cost of producing Flemish luxury woollens, still produced uniquely from the finest English wools.⁶⁶

For the relative values of the Ghent *dickedinnen* in terms of the value of the Brabant commodity baskets and of the purchasing power of an Antwerp master mason's daily wage, the data are roughly comparable for the second half of the fifteenth century, if we take into account the lower real wages that still persisted in Antwerp. In the sixteenth century, the value of the Ghent *dickedinnen* in terms of the value of commodity baskets and also in terms of the purchasing power of a mason's wage, remained high, until the onset of the inflationary Price Revolution, from about 1515, when, as noted earlier, commodity prices (in

⁶⁵ For the evidence, see Munro, 'Builders' Wages', pp. 1041-76 (including tables and graphs). For both principalities, one may readily observe that textile prices, other commodity prices (i.e., those in the 'basket'), and money wages did not change in tandem with each other.

⁶⁶ See Table 1; and Munro, *Wool, Cloth, and Gold*, pp. 65-179; John Munro, 'An Economic Aspect of the Collapse of the Anglo-Burgundian Alliance, 1428-1442', *English Historical Review*, 85 (1970), 225-44; reprinted in John Munro, *Bullion Flows and Monetary Policies in England and the Low Countries, 1350 - 1500*, Variorum Collected Studies series CS 355 (Aldershot, Hampshire; and Brookfield, Vermont: Ashgate Publishing Ltd., 1992); Munro, 'Wool Price Schedules', pp. 118-69; Munro, 'Anglo-Flemish Competition in the International Cloth Trade, 1340 - 1520', pp. 37-60; Munro, 'Symbiosis of Towns and Textiles', pp. 1-74; Munro, 'Spanish *Merino* Wools and the *Nouvelles Draperies*', pp. 431-84.

that basket) rose more than did textile prices and much more than did wages.⁶⁷ Thus, in the quinquennium 1506-10, a single Ghent *dickedinnen* was worth 19.060 Brabant commodity baskets (compared to, say, 11.706 baskets in 1441-45), and 436.505 wages (more than two year's income) of an Antwerp master mason. But by the quinquennium 1541-45, that relative value had fallen to just 10.267 Brabant commodity baskets, and 255.453 days' wages. By the end of this price series, in 1566-70, those relative values had risen once more: to 13.620 commodity baskets and 208.966 days' wages of an Antwerp master mason. Over the entire 235 year period, the trend of Ghent cloth values was rising, especially from the mid-fifteenth century, though not in any truly distinct and persistent fashion.

The late-medieval scarlets: the costliest and most luxurious of all late-medieval woollens

Tables 7 - 10 now introduce us to the most luxurious of all late-medieval woollens: the 'scarlets' (*scaerlakenen* in Flemish; *écarlates*, in French; *scarlatti*, in Italian). As can readily be seen in these tables, such 'scarlets' were substantially, indeed vastly, more expensive than any other dyed cloths, rivalling fine silks in value.⁶⁸ Such 'scarlet' woollens were, to be sure, also necessarily woven from the very finest English wools, then the best in the world. That is no key distinction, however, for many other fine woollen broadcloths were also woven from these very same costly wools (in Italy and France, as well as the Low Countries and England).⁶⁹

For reasons that I have examined at length in several other publications, the true essence of any medieval scarlet was in containing, if not necessarily uniquely, the vivid red dyestuff known as *kermes*, a

⁶⁷ See Munro, 'Money, Wages, and Real Incomes in the Age of Erasmus', pp. 551-699; Munro, 'Monetary Origins of the Price Revolution', pp. 1-34; Munro, 'The Price Revolution', vol. 6, pp. 631-34.

⁶⁸ For a comparison of the prices of fifteenth-century silk fabrics, scarlets, and other dyed woollen broadcloths, nn. 6 and 20 above.

⁶⁹ See Table 1 and nn. 2 and 6 above; and especially Munro, 'Medieval Scarlet', pp. 13-70 (esp. Tables 3.4 - 3.14); Munro, 'The Anti-Red Shift', pp. 55-95 (esp. Tables 4.2 - 4.5); Munro, 'Wool-Price Schedules', pp. 118-69; Munro, 'Medieval Woollens', pp. 186-91; and Table 5.1, pp. 299-301 (English wool prices, with export duties, from 1210 to 1500); Table 5.2, pp. 302-303 (English wool prices at the Calais Staple, in 1475 and 1499); Table 5.3, pp. 304-05 (English woolsack and broadcloth exports, 1281-1545); and Munro, 'Spanish Merino Wools', pp. 431-84. See also Munro, 'I panni di lana', pp. 105-41.

word derived from the Arabic *qirmiz*, meaning ‘worm’. Similarly, the late-Latin term *vermiculus*, also meaning a ‘worm’, is the origin of the related red colour term ‘vermilion’. The *kermes* dyestuff was extracted at enormous cost from the eggs of Mediterranean and Caucasian (Georgian-Armenian) scale-insects of the genus *Kermococcus vermilio* (sometimes referred to incorrectly as *Coccus ilicis*). Because these desiccated eggs resembled grains – of wheat, salt, sand – the common term for this medieval dyestuff was indeed ‘grain’ (English): *granum* in Latin, *grano* in Italian, *graine* in French, *grein* in Flemish and German. Subsequently, in early-modern Europe, a somewhat cheaper dyestuff, Mexican *cochineal*, came to displace *kermes* for producing scarlet dyes; and from the 1860s they were displaced by aniline dyes.⁷⁰

While late-medieval, early-modern English texts reserved the word ‘scarlet’ for only those fine woollens dyed uniquely in *kermes*, texts from the late-medieval Low Countries used the equivalent term *scarlaken* (or: *scaerlaken*) to refer to a variety of red and differently coloured woollens: such as ‘brown’, ‘perse’ (a blue-greyish or ashen purple) or ‘murrey’ (mulberry), ‘sanguine’ (bluish red) *scaerlaken*. The explanation to resolve this seeming paradox is quite simple. For a wide variety of late-medieval Flemish and Brabantine textile accounts indicate, without exception, that all such *scarlaken* were first dyed with blue-woad (or indigo) in the wools or yarns, sometimes with other dyestuffs, and then redyed ‘in the piece’ (after fulling) with *kermes* (grain) to produce this varied range of shades or colours. None of the accounts on textile expenditures provides any evidence that any of these variously coloured *scarlaken* were any cheaper than those dyed uniquely in *kermes*, known as *roode scaerlaken*; and all, without exception, were always vastly more expensive than any other fine woollens dyed without *kermes*.⁷¹

⁷⁰ See Munro, ‘The Medieval Scarlet’, pp. 13-70, in particular tables 3.4-3.5, pp. 40-01; Munro, ‘The Anti-Red Shift’, pp. 56-76 and 87-93; especially Tables 4.2 and 4.3; and see also Dominique Cardon, *Les ‘vers’ du rouge: insectes tinctoriaux (Homoptera: Coccoidea) utilisés dans l’ancien monde au moyen-âge: essai d’entomologie historique*, Cahiers d’histoire et de la philosophie des sciences no. 28, Société française d’histoire des sciences et des techniques (Paris, 1990). Thanks to the experiments of the British scientist William Perkin, in 1856, first mauve and then other dyes have been chemically synthesized as aniline dyestuffs [C₆H₅(NH₂)] from coal tars, at a fraction of the cost of former vegetable and animal dyestuffs. See Jenkins, ‘The Western Wool Textile Industry’, p. 764.

⁷¹ See Munro, ‘Medieval Scarlet’, pp. 29-63; Munro, ‘Red Shift’, pp. 56-76. White scarlets were those undyed, unfinished woollen broadcloths that were commissioned to be dyed uniquely in grain, to produce

Tables 7 - 9: on Flemish *Scaerlaken* and other fine dyed woollens, in Bruges and Mechelen

The first of these tables, Table 7a - b, covering the period from 1301 to 1496 (in quinquennial means), presents Bruges' cloth prices: again in pounds *groot* Flemish, for those broadcloths purchased for the mayors and aldermen of Bruges. The significant feature of Table 7a is in distinguishing the prices for 'scarlets' (*scaerlaken*), those dyed partly or wholly with kermes ('in grain'), from all the other broadcloths whose various colours were based on other dyestuffs, excluding kermes. Part 7b of this table provides again the number of days' wages that a Bruges master mason would have spent in acquiring both a scarlet and a differently dyed woollen broadcloth. Similarly, it also provides the value of both scarlets and other broadcloths in terms of the money-of-account value of the Flemish 'basket of consumables'. This table ends in 1496 when individual cloth prices ceased to be given in the Bruges *stadsrekeningen*. In comparing Tables 7a and 7b, one will observe that, in general, with occasional exceptions, the prices for non-scarlet Bruges woollens were lower than those for the Ghent *dickedinnen* broadcloths (Tables 3 - 6); but the trends for cloth prices and relative values are roughly similar, as would be expected.

Tables 8 - 10 concern the prices and values of scarlets and other high-priced woollen broadcloths produced in Mechelen. Table 8 itself presents the prices and values of Mechelen scarlets in their heyday, from 1361-65 to 1411-15, in quinquennial means: in pounds *oude groot* of Mechelen, converted into pounds *groot* Flemish from 1370, when reliable exchange rates become available (from the town accounts). Once more the 'real' values of these scarlet broadcloths are presented in terms of the number of days that a master mason (in Bruges) would have had to spend to acquire one of these scarlet woollen broadcloths (40 ells = 28.0 metres); and the values of these scarlets are also expressed in terms of the money-of-account values of the Flemish commodity basket: i.e., the number of such baskets equal in value to the price of one scarlet. The companion

red scarlets (*roode scaerlakenen*), as the accounts also make absolutely clear, according to the Flemish tripartite textile technology that distinguished between 'white' cloths, 'blue' cloths, and 'medley' cloths. 'Medley' cloths – *geminghede* and *strijpte lakenen* – were the same fine woollens that were woven from either a mélange of variously coloured wools, both blue and red, or cloths that were woven from warp yarns whose colour was different from that of the weft yarns. It was fairly common to redye these latter woollens 'in grain', to produce, for example, *strijpte scaerlakenen*.

Table 9 presents the costs of dyeing and finishing these Mechelen scarlets, in quinquennial means, again for the same time period: 1361-65 to 1411-15.

The table does not go past 1415, because the last recorded purchase of a scarlet in Mechelen was in 1416. The number of such scarlets similarly diminished sharply in the Flemish towns from the early fifteenth century; and they virtually disappeared from the town accounts of cloth purchases in Bruges, Mechelen, Ghent, and other cities by the later fifteenth century. Why scarlets, having been so highly favoured throughout Europe in the fourteenth century, especially in the era following the Black Death, as the most luxurious and the most expensive of all European woollens, then fell out of favour – at least in northern Europe – is a question not easily answered. But I have offered an explanatory hypothesis for this curious phenomenon in a recent article, whose key points are summarized below in the introduction to Table 10.⁷²

Finally, a close examination of the often very detailed textile accounts clearly vindicate the view that the true essence of the medieval scarlet was its *kermes* dyestuffs, for they do not indicate that any other factor, other than costly fine English wools, had any significant bearing on these prices. Contrary to popular but quite erroneous views still prevalent in the textile-history literature, the true nature and the high value of scarlets had nothing to do with shearing and the finishing processes, which, as Table 9 and the following details clearly demonstrate, were always far too low to justify any such interpretation, in particular the still favoured ‘shearing’ hypothesis.⁷³ In providing the costs of producing scarlets in Mechelen, from 1361 to 1415, Table

⁷² For this article, see the one previously indicated: Munro, ‘The Anti-Red Shift’, esp. pp. 56-77, 84-86, 91 (n. 49). The last purchase of a scarlet recorded in the Bruges town accounts was in 1482 (see the sources for Table 7a, below); in Ypres, the last documented purchases was in 1486. See Munro, ‘Medieval Scarlet’, Table 3.5, p. 43. In fifteenth-century Italy, however, scarlets certainly continued to be popular. In the years 1451-76, the Florentine woollen cloth industry accounted for 13,528 of the total of 27,210 woollens sold in Rome (virtually half: 49.72 percent); and of these Florentine woollens, 5,354 (39.58 percent) were extremely costly kermes-dyed scarlets (*panni di grana*). See Hidetoshi Hoshino, *L'arte della lana in Firenze nel basso medioevo: il commercio della lana e il mercato dei panni fiorentini nei secoli XIII-XV* (Florence: Leo S. Olschki Editore, 1980), Tables XLII-XLIII, pp. 286-87.

⁷³ The linguistic source of this view is based on the supposition that the Flemish term *scaerlaken* was derived from the Flemish verb *scheren* (to shear) and the noun *laken* (cloth). The scholarly elaboration of that etymological thesis, accounting for the ongoing popularity of this erroneous notion, is to be found in just one publication: Jean-Baptiste Weckerlin, *Le drap ‘escarlate’ au moyen âge: essai sur l’étymologie et la signification du mot écarlate et notes techniques sur la fabrication de ce drap de laine au moyen âge* (Lyons:

9 indicates that the kermes (grain) dyestuff often cost more than the fine English wools used in weaving them.

Those dyeing costs were a function or combination of both the quantity of kermes used and the often sharply varying prices of the dyestuff (with different origins) itself. During this period, the quantity and the cost of the kermes used in producing a single *scaerlaken* ranged from a low, and singularly unusual low, of 8.287 kg in Easter 1403, when the cost of the kermes (grain) was 55.47 percent of the value of the undyed woollen broadcloth and 23.36 percent of the value of the fully finished scarlet. The highest quantity of kermes recorded in producing a single *scaerlaken* was three times as much, 25.809 kg, in Easter 1380, when the cost of the kermes was 154.91 percent of the value of the undyed cloth and 58.73 percent of the fully finished scarlet. But since the cost of the grain was also determined by its unit market value, sometimes kermes accounted for an even greater share of the total value of the scarlet: e.g., in Easter 1379, for 181.32 percent of the value of the undyed woollen and 62.29 percent of the final value.

In striking contrast, for the cloth-finishing processes, the mean cost of the labour involved in dyeing and shearing combined was only, on average for the entire period, 2.75 percent of the total values of these scarlets, ranging from a low of 1.03 percent in 1363 to an abnormal high of 4.56 percent at Christmas 1380. In the fifteenth-century Ypres accounts (for 1406 - 86; not presented here), the mean cost of the kermes dyestuffs (averaging 29.85 lb. or 13.85 kg per cloth), was 36.1 percent of the total cloth price; the labour cost of dyeing, 3.4 percent; and the cost of shearing and finishing, just 1.5 percent of the cloth price.⁷⁴ Clearly the labour costs in cloth finishing had virtually no significance for the final price of medieval scarlets.

While it remains perfectly true that, in the heyday of the late-medieval scarlet, such woollens always cost substantially more than any other fine woollen broadcloth, by the sixteenth century, the 'real values' of other dyed broadcloths came to approach rather more closely the 'real values' of mid-fifteenth-century scarlets.

A. Rey, 1905), esp. p. 12. I explore the etymological origins and evolution of the term 'scarlet' – unknown in the ancient world (before 1000 CE) – offering alternative explanations, in Munro, 'Scarlet', pp. 18-65; and Munro, 'Red Shift', pp. 56-76.

⁷⁴ See Munro, 'The Medieval Scarlet', pp. 13-70, in particular tables 3.4-3.5, pp. 40-01; Algemeen Rijksarchief België, Rekenkamer, nos. 38,636 - 38,710 (Stadsrekeningen Ieper, 1406-1486).

Thus, as the previously examined Table 2 indicates, for the year 1535, an Antwerp master mason would have had to spend 348.31 days' wages to acquire one Ghent *dickedinnen* broadcloth. But, earlier, in 1441-45 (when real wages had reached their medieval peak), a Bruges mason would have spent only an average of 230.575 days' wages to purchase a scarlet (Table 7b).⁷⁵ In Mechelen, in late 1398, a master mason would have spent even less, only 209.76 days' wages, to purchase a scarlet.⁷⁶ On the other hand, in fourteenth-century Bruges, a master mason would have had to spend the following number of day's wages just in order to buy one Bruges-made scarlet (*scaerlaken*): in 1353, 468.00 days; in 1371, 483.16 days; in 1385, 601.88 days; in 1391, 530.67 days' wages.⁷⁷ Returning to Mechelen, in 1415, we find that a Bruges master mason would have had to spend 410.77 days' wages to buy one Mechelen-made scarlet.⁷⁸ Obviously, the real values of scarlets varied considerably – chiefly because of differences in both the costs of the dyestuffs and the quantities used – but also, as will be explained further in the conclusion to this study, because of changes in the purchasing power of labour and in the values of the 'baskets of consumables'.

Table 10: Mechelen *Rooslaken*, 1470 -1550

In Mechelen, as I have sought to demonstrate in a recent article, the one just indicated above, we find another remarkable transformation in luxury textile consumption by the later fifteenth century: a marked shift from not only scarlets but also from other red-coloured (including mixed colours) broadcloths to those dyed with very dark colours, which became predominantly black, overwhelmingly so by the sixteenth century. Thus, of all such woollens purchased for the burghermasters and aldermen of Mechelen's town government, black accounts for the colour of 75.04 percent of the woollens (and 81.67 per cent, by value), in the eighty-year

⁷⁵ For the quinquennial harmonic mean values (i.e., for five-year periods) of the Bruges scarlets, in terms of the number of days' wages that a master mason would have had to spend to acquire just one such scarlet, see Table 7:a.

⁷⁶ For the quinquennial harmonic mean values (i.e., for five-year periods) of the Mechelen scarlets, in terms of the number of days' wages that a master mason would have had to spend to acquire just one such scarlet, see Table 8.

⁷⁷ See Table 7a.

⁷⁸ See Table 8.

period from 1471 to 1550 (186.25 out of 190.833 so purchased), but almost 100 percent in the period 1500 to 1550.⁷⁹ The accompanying Table 10 presents, again in quinquennial means, the prices, in both pounds *groot* Brabant and Flemish, of black (*zwart*) *rooslaken* broadcloths, from 1471-75 to 1546-50. These Mechelen *rooslaken* broadcloths are the same as those that were featured in Table 2, above. This table similarly presents the real values of these textiles in terms of the number of days' wages that an Antwerp mason would have spent in acquiring one of these cloths, and also the number of days' wages required to purchase a Brabant 'commodity basket'.

The next set of textile tables: 11 - 16: for England and the southern Low Countries

Table 11 provides the prices, in pounds sterling, of English woollen broadcloths, in quinquennial means, from 1361-65 to 1516-20, in pounds sterling: first and second quality broadcloths purchased for the colleges of Cambridge (for clerics and servants) and for Winchester (first quality only). These prices may be compared to the quinquennial means of cloth export values: those from the two major ports of London and Southampton, and for all English ports together. Cloth export prices are given not only in pounds sterling, but also in the equivalent values in pounds *groot* Flemish and in Florentine gold florins. Table 12 provides (again) the quinquennial mean prices, in pounds sterling, of both first and second quality woollens purchased for the Cambridge colleges and Winchester college (scholars and servants). It also presents the quinquennial means of a master mason's daily wage (in SE England), the value in pence sterling of the Phelps Brown and Hopkins 'basket of consumables), and the Consumer Price Index (base 1451-75 = 100), as calculated from the values of these baskets.⁸⁰ This table also differs from the previous one in extending the price and value series from 1521 to 1560. Table 13 provides the values of the first quality woollens, for both Cambridge and Winchester colleges, in terms of the number of days' wages that a master mason at Cambridge would have

⁷⁹ Munro, 'The Anti-Red Shift', pp. 55-6, 87-93.

⁸⁰ Phelps Brown and Hopkins never published these values, in pence sterling (see n. 51, above). Instead, I calculated these values in pence sterling from their worksheets, in the Archives of the British Library of Political and Economic Science, while also correcting hundreds of errors in their own calculations. My methodology in computing the annual values of these baskets has been explained in Munro, 'Builders' Wages in Southern England and the Southern Low Countries', pp. 1014-28.

spent in acquiring one of each, and the equivalent values of these textiles expressed as the number of the Phelps Brown and Hopkins commodity baskets. Again, the means for these four value series are harmonic, rather than arithmetic.

As will be readily apparent from all these tables, these English woollen broadcloths, though considerably less expensive than the finer or finest Flemish and Brabantine woollens, were still not ‘cheap’; and demonstrably they were luxury cloths, by any measure. In the later fourteenth century and for much of the fifteenth century, the first quality woollens purchased at Cambridge were generally more expensive than those purchased at Winchester; but from the early sixteenth century Winchester’s first-quality woollens were generally the more expensive – and obviously far too expensive for any English master masons.⁸¹

The export-price statistics, taken from the English Customs Accounts, expressed here in both pounds sterling and pounds *groot* Flemish, in Table 11, do offer an interesting perspective: in validating the prices of woollens purchased for these colleges, while the mean values are necessarily, by that arithmetic computation, lower than the prices for the first-quality woollens at those colleges. While nominal prices are an imperfect measure, for the reasons mentioned earlier (especially after Edward IV’s 20.0 percent debasement of the silver coinage in 1464), that rise in value can also be seen in the export price-statistics (Table 11), which show a rise in the mean value of a broadcloth from £1.403 sterling (£1.471 *groot* Flemish) in 1396-1400 to one of £3.606 sterling (£5.308 *groot* Flemish) in 1511-15, just before this series ends in 1520.

A similar picture emerges from Table 13, in presenting the values of the first quality English woollens, as measured in the number of days’ wages required for their purchase by a master mason. That number ranged from an unusual low of 83.150 days’ wages in 1436-40 (Cambridge) to a high of 133.49 days’ wages in 1381-85 (also Cambridge); but then, in the later fifteenth and early sixteenth centuries, their relative value rose, reaching the equivalent of 162.63 days’ wages in 1516-20 (Cambridge), and thereafter even more, with a maximum of 258.85 days’ wages – i.e., 1.23 year’s money-wage income – in 1546-50 (but at Winchester).

⁸¹ Those master masons at Oxford and Cambridge were still earning only 6d per day, until the 1536, when the wage rate rose to 6.5 d per day, and to 7d, in 1542. Phelps Brown and Hopkins, ‘Building Wages’, pp. 1-12.

In part this ‘rise’ in the relative values of these woollens reflects the fall in the real wages of building craftsmen, when their wages failed to keep pace with the general rise in commodity prices, from the onset of the inflationary Price Revolution, from about 1515.

We should also consider the alternative value of these cloths: as expressed as the number of commodity basket having an equivalent value, in pounds sterling. We observe a general rise in their ‘real values’, from a mean of 3.011 baskets in 1361-65 to one of 5.424 baskets in 1441-45 (both Winchester woollens); while experiencing a brief decline in the mid fifteenth century, the ‘real’ values of these woollen then continued to climb, reaching 7.795 baskets (Cambridge) and 6.067 baskets (Winchester) in 1476-80. With subsequent declines and recoveries, these ‘real values’ for the Cambridge and Winchester woollen reached a sixteenth-century peak of 7.490 baskets (Winchester) and 6.854 baskets (Cambridge) in 1541-45, indicating that textile prices had risen more than had the value of the English ‘basket of consumables’. At the end of this series, in 1556-60 (when inflation outpaced the rise in textile prices), the Winchester woollens were worth only 5.492 commodity baskets; and the Cambridge woollens, only 4.580 baskets.

Next, the corresponding Table 14 (Part II of this series) presents the prices and values of Flemish woollens, in quinquennial means, from 1351-55 to 1496-1500, or for Ghent *dickedinnen* broadcloths (but up to 1546-50), and broadcloths manufactured in Ypres, Bruges, and three of the so-called ‘nouvelles draperies’. The latter were new and rival upstarts from the smaller Flemish towns of Wervik, Kortrijk, and Nieuwkerk (Neuve-Eglise) that had been challenging the supremacy of the older traditional *drie steden* (Ghent, Ypres, Bruges), from the later fourteenth century, by producing counterfeit imitation of their woollens, but nevertheless still genuine, heavy-weight fine broadcloths.⁸² Table 15 (Part III of this series) presents the prices and relative values of fine woollens manufactured in the two chief textile towns of Brabant, again in quinquennial means, from 1351-55 to 1546-50: those of Leuven and Mechelen (again, but now commencing

⁸² See in particular Munro, ‘Medieval Woollens: Textiles, Textile Technology’, pp. 182-91; Munro, ‘Medieval Woollens: West European Woollen Industries’, pp. 249-62, 288-90; Munro, ‘Origins of the English New Draperies’, pp. 35-66; and especially Munro, ‘Spanish *Merino* Wools and the *Nouvelles Draperies*’, pp. 431-84. These three ‘nouvelles draperies’ in this table were amongst those that came to substitute Spanish *merino* wools for at least some English wools, from the later 1420s.

in 1366-70, and with a wider variety of broadcloths in the quinquennial mean price). Finally, Table 16 (Part IV of this series) provides a direct comparison of the prices and relative values of first quality woollen broadcloths in both Ghent (*dickedinnen*) and Bruges: i.e., in terms of both the number of days' wage that a master mason needed to acquire one of these cloths, and the value of the various woollens expressed as the number of commodity baskets that each cloth was worth.

Table 17: Polish Markets for European Woollen Textiles in the early Fifteenth Century

The final textile table, Table 17, provides a snapshot of European woollen cloth prices, for broadcloths of Italy, Flanders, Brabant, Holland, and England, as sold in Polish markets in the very early fifteenth century. The prices are presented in Polish *groszes* per ell, in Flemish pounds *groot*, English pounds sterling, and Florentine gold florins.

Conclusions (I): problems in measuring the 'real' values of textiles

If the statistical evidence presented in these 17 tables may seem somewhat overwhelming, they do provide a convincing demonstration of the range of woollen textile values, and the true meaning of luxury, indeed ultra-luxury consumption, over three centuries of European history: from the fourteenth to sixteenth.

A major contribution of this essay has been the provision of three new methods of estimating and representing 'real' values of these various cheap and costly textiles over the three centuries being surveyed, all of them, as I have contended, vastly preferable to the standard and traditional method of using so-called 'silver equivalents'. The first two are related, in that both involve, directly and indirectly, consumer price indexes: those for England, Flanders, and Brabant. For each of the textiles concerned, I calculated a 'real' price index with the same 25-year base used for the 'consumer baskets'. Hence, as stressed earlier, if the particular cloth price index (e.g., for the Ghent *dickedinnen*) rose more than did the consumer price index, then we may conclude that its 'real' value had also risen. The second new method was the computation of the specific number of such 'baskets of consumables' whose aggregate money-of-account value equalled the market value of the textile concerned. Thus, again, if the number of such baskets worth one unit of the textile concerned rose, then we may similarly conclude that its real value had risen proportionately. This technique

is especially valuable for any prices series in which data are missing for any years in the base period (1451-75). The third, and seemingly related technique employed in this study, was to estimate the number of days' wages that a master building craftsman – a mason (brick or stone) or a carpenter, usually paid the same – would have had to spend in order to acquire one unit of the textiles concerned.

In the short run –as for example, in the years 1535 to 1544, in Table 2 – all these methods seemed to provide equivalent results for real values. But Table 2 represents only a very short term snapshot. If we compare such textile values a century apart, we find instead a lack of congruity, and thus a measure of statistical indeterminacy. The prices in Flemish pounds *groot*, for absolutely identical Ghent *dickedinnen* broadcloths, were earlier shown to be as follows: in 1441-45, a quinquennial mean value of £8.008 *groot*; and in 1535-44, a quinquennial mean value of £13.657 (see Table nos. 3 - 6). Are the price differences purely the result of the intervening inflations over this century, or are there in fact any 'real' differences? That depends on how the measure chosen. For in 1441-45, the mean value of such a *dickedinnen* was 13.330 Flemish commodity baskets, but in 1535-44, it was significantly less – 10.685 baskets (though in commodity baskets of Brabant). However, if the measure is the purchasing power of wages, we find that in 1441-45, a master mason (Bruges) would have had to spend 174.26 days' wages to purchase one such *dickedinnen* broadcloth; but, in 1535-44, an Antwerp mason would have had to spend much more (53 percent more) for the same purchase – 265.95 days' wages.⁸³ These rather stark differences represent the very sharp fall in 'real' industrial wages over this century (and perhaps regional differences as well), on the one hand, but also a relative decline in the value of Ghent *dickedinnen* woollens in relation to other consumer commodity prices by the 1540s, when the Price Revolution was well under way, with steeply rising food prices in particular.⁸⁴

Conclusions (II): Changes in Real Incomes, Textile Values, and Consumer Expenditures since the Sixteenth-Century

Finally, however, and despite such caveats, let us compare the purchasing power of building craftsmen

⁸³ See Tables 2, 3, 4, and 5 above, for the relevant data.

⁸⁴ See sources cited in n. 43 above.

in the period for Table 2, 1535-1544, with that of a modern-day building craftsmen in Toronto (Canada), for textiles. As was indicated in the earlier analysis of this Table 2, the average number of days' wages required to purchase a quantity of cloth sufficient for a full suit of clothing (for that era), namely 12 square metres, would have been as follows: 13.725 days' wages for a Hondschoote single say, and 5.4 times as many days, 91.413 days' wages for a Ghent *dickedinnen*.⁸⁵

A contrast with the purchasing power of the current-day modern building craftsmen is very striking. Thus, in August 2008, a journeyman carpenter in Toronto earns a minimum of \$33.07 per hour; and thus, with a standard working day of 8 hours (vs. 12 hours in the sixteenth century), he would receive a daily wage income of \$264.56 (= €165.35). For the 91.413 days required for a master mason's purchase of 12 sq. m. of the aforesaid Ghent *dickedinnen* in 1538-44, he would earn \$24,184 CAD (about €15,115). For the 13.725 days' wages required for that mason's purchase of the supposedly 'cheap' Hondschoote single say (1538-44), the same Toronto carpenter today would also earn a very considerable sum: \$3,631 CAD (or about €2,269). Instead, today's Toronto carpenter would need to spend only a very few days' wage income to purchase a very fine wool-based suit.⁸⁶

One might cavil, however, that such an expenditure would be in after-tax income; and that this comparison does not fairly take into account differences in taxation between the sixteenth and twenty-first centuries. But if the sixteenth-century Low Countries' had no income taxes, this region had very oppressive consumption (excise) taxes, which posed particularly a great burden for most industrial wage-earners.⁸⁷

What, therefore, is the final lesson to be learned from this study on the relative values of textiles and

⁸⁵ See p. 000 above, and Table 2.

⁸⁶ In the post-Christmas sales of late Dec. 2007, I purchased such a fine wool-based suit on sale in Toronto for \$512.00 CAD (€320) – but the regular price was double that amount. Some wealthy men, but presumably not carpenters (nor me), might spend several thousand dollars on a suit. Obviously women's clothing, then and now, cannot enter into this same comparison.

⁸⁷ See Munro, 'Urban Public Finances in Late-Medieval Flanders', pp. 973-1026. England, however, did have a progressive income tax, under Henry VIII (abolished in the reign of Elizabeth), but no such consumption taxes, before the 1640s. See Roger Schofield, *Taxation Under the Early Tudors, 1485 - 1547* (Oxford: Blackwell Publishing, 2004).

of the purchasing power of a building craftsmen's labour, during the later-medieval and early-modern eras? Clearly, this striking evidence demonstrates the enormous gains in real incomes and living standards from the sixteenth to the early twenty-first centuries. Such gains are indisputably the product of general European and North American economic growth: a growth in Total Factor Productivity (land, labour, and capital), which in turn is fundamentally the consequence of modern industrialization, so often maligned in the historical literature. Let us remember in particular that the very core of the British Industrial Revolution, from the 1770s, and then of subsequent industrialization in Europe and Asia, was first water-powered and then steam-powered mechanization of textile manufacturing, within a new factory system of production. In the case of the cotton industry, such technological changes reduced costs and then consumer prices on the order of 90 percent.⁸⁸ In perspective, we should also realize that productivity in the woollen cloth industry had remained virtually unchanged from the fourteenth to the late eighteenth centuries. On average the production and finishing of a standard broadcloth had taken about three weeks, or more; and most drapers or clothiers were able to produce only about 20 such cloths a year, both in England and the Low Countries.⁸⁹

⁸⁸ See Stanley Chapman, *The Cotton Industry in the Industrial Revolution* (London, 1972), especially the table on p. 20; and note that mechanization also involved the cotton gin, with a dramatic fall in the cost of raw cotton; see also Douglas Farnie, 'Cotton, 1780 - 1914', in David Jenkins, ed., *The Cambridge History of Western Textiles* (Cambridge: Cambridge University Press, 2003), Vol. II, pp. 721-60. For woollen and worsted textiles, see Jenkins, 'The Western Wool Textile Industry', pp. 761-89; and Jenkins and Ponting, *The British Wool Textile Industry*, pp. 27-56, 77-124.

⁸⁹ Walter Endrei, 'Changements dans la productivité de l'industrie lainière au moyen âge', *Annales: E.S.C.*, 26 (1971), 1291-99; Endrei, 'La productivité et la technique dans l'industrie textile du XIII^e au XVII^e siècle', in Sara Mariotti, ed., *Produttività e tecnologia nei secoli XII-XVII* (Florence, 1981), pp. 253-62; Endrei, 'The Productivity of Weaving in Late Medieval Flanders', in Negley B. Harte, and K. G. Ponting, eds., *Cloth and Clothing in Medieval Europe: Essays in Memory of Professor E. M. Carus-Wilson*, Pasold Studies in Textile History no. 2 (London, 1983), pp. 108-19; Endrei, 'Manufacturing a Piece of Woollen Cloth in Medieval Flanders: How Many Work Hours', in Erik Aerts and John Munro, eds., *Textiles of the Low Countries in European Economic History*, Proceedings of the Tenth International Economic History Congress, Studies in Social and Economic History, Vol. 19 (Leuven, 1990), pp. 14-23; Raymond Van Uytven, 'Technique, productivité, et production au moyen âge: le cas de la draperie urbaine aux Pays-Bas', in Sara Mariotti, ed., *Produttività e tecnologia nei secoli XII-XVII* (Florence, 1981), pp. 283-94. According to an English Parliamentary commission report for the period 1781 - 1796 (before the introduction of any machinery), two men and a boy weaving a superfine broadcloth of 34 yards, with 70 lb. of wool, then required 364 man-hours (= about 15 days per man); and another 888.3 man-hours were spent in wool preparation, spinning, reeling, and warping; and a further 207 hours in cloth finishing, for a total of 1459.35 hours in total cloth manufacturing. See Lipson, *Woollen and Worsted Industries*, Appendix II, p. 258, based on Great Britain,

But, for the more general consideration of living standards for the working and lower classes, we must understand that the major improvements took place, not so much from the commencement of the British Industrial Revolution itself, but rather from a full century later, from the 1870s, and most especially from after World War II. Who can really doubt the benefits of modern economic growth when we realize that, in England, for example, the crude death rate fell from 30 per thousand in the 1540s to just 10/1000 today (7/1000 in Canada), and that life-expectancy (from birth) in England has risen, and well more than doubled, from 34 years in the 1540s, to 79 today (80 in Canada).⁹⁰

Equally dramatic are the differences in consumer expenditure shares between the fifteenth century (i.e., for the base period of 1451-75) and today. For their English 'basket of consumables' price index, Phelps Brown and Hopkins allocated a full 80 percent to food and drink. I allocated virtually the same, 79.99 percent, for food and drink in my Flemish price index, while Van der Wee allocated somewhat less, 74.19 percent for his Brabant price index.⁹¹ That was not any casual estimate, but one closely based on examinations of household consumer patterns for wage-earners from the mid-fifteenth to the late eighteenth-century; and

Parliamentary Paper, 1840 (London, 1840), vol. 23, pp. 439-42. For a late seventeenth-century estimate (Matthew Hale, 1683) three weeks for the production of a fine woollen broadcloth, see *Ibid.*, Appendix 1, p. 257. For other documents on cloth-manufacturing costs in the eighteenth-century English woollens industry, see Mann, *Cloth Industry*, Appendix III, pp. 321-29. See also n. 26 above.

⁹⁰ For England in the 1540s, see: E.A. Wrigley, R.S. Davies, J.E. Oeppen, and R.S. Schofield, *English Population History from Family Reconstitution, 1580-1837* (Cambridge and New York: Cambridge University Press, 1997), Appendix 9, pp. 613-6. See also E.A. Wrigley and R.S. Schofield, *The Population History of England, 1541 - 1871: A Reconstruction* (Cambridge and New York: Cambridge University Press, 1980), pp. 528-29. For the world in 2007, see: *2007 World Population Data Sheet* (Population Reference Bureau): <http://www.prb.org/>.

⁹¹ Phelps Brown's 80% budget allocation for food and drink – 81.70% according to my calculations – consists of 20.00% for bread grains (19.33% according to my calculations), 22.50% for drink (21.48% according to my calculations), and 37.50% for meat, fish, and dairy products (40.89% according to my calculations). Van der Wee's total budget allocation for food and drink (Brabant), with a share of 74.19%, consisted of: 18.24% for bread grains, 17.08% for drink, and 38.87% for meat, fish, and dairy products combined. My total budget allocation for food and drink, with a share of 79.99% (for Flanders), consisted of 24.19% for bread grains, 20.43% for drink, and 35.37% for meat and dair products: See nn. 40, 42, 80 above; and in particular Phelps Brown and Hopkins, 'Prices of Consumables', Table 1, pp. 297-98; Van der Wee, 'Prices and Wages as Development Variables', pp. 58-78; and Munro, 'Wage Stickiness', Table 1, p. 231.

the same was true for Van der Wee's 'basket of consumables' price index for Brabant (Antwerp-Lier-Brussels region).⁹² In modern-day Canada (August 2008), the current Consumer Price Index share for food and drink combined is only 20.11 per cent (17.04 percent for food, and 3.07 percent for alcoholic beverages and tobacco).⁹³ Consider as well the striking differences in the shares allocated for clothing: in the Phelps Brown & Hopkins index for England, it is 12.50 percent; in Van der Wee's index for Brabant, it is somewhat higher, at 18.00 percent; but in modern-day Canada, it is only 5.36 percent (for both clothing and footwear).

Of the three basic necessities considered here, the only uncertainty lies in the category of 'shelter', for which the current Canadian share in the Consumer Price Index is 26.62 percent (plus 11.10 percent for 'household operations and furnishings'). For neither the Phelps Brown & Hopkins index and the Van der Wee index was there sufficient data for to estimate expenditure shares for housing, but only for domestic fuels and light: a 7.50 percent share in the Phelps Brown & Hopkins index, and a 7.31 percent share in the Van der Wee index.⁹⁴

In sum, modern industrialization and economic growth have permitted European and North American societies to reduce drastically their consumer expenditure shares on at least two of the three 'necessities', food

⁹² Phelps Brown & Hopkins' budget shares were based upon K.L. Wood-Legh, *A Small Household of the Fifteenth Century* (Manchester, 1956), for the base period of 1451-75; and for the late eighteenth-century they used, in particular, Sir Frederic Morton Eden, *The State of the Poor: An History of the Labouring Classes in England from the Conquest to the Present Period*, 3 vols. (London: J. Davis, 1797). Van der Wee's sources may be found in Herman Van der Wee, 'Voeding en Dieet in het Ancien Régime', *Spiegel Historiae*, 1 (1966), 94-101, republished in translation: as 'Nutrition and Diet in the Ancien Régime', in Herman Van der Wee, *The Low Countries in the Early Modern World*, trans. by Lizabeth Fackelman (Cambridge and New York, 1993), pp. 279-87: in particular, those for the Beguinage Infirmary of Lier (1526-1602); the St. James Hospice at Lier (1450); an Antwerp orphanage, 1586-1600 (listing food expenditures for Antwerp labourers employed there); the soldiers of the Antwerp garrison (1568); and the soldiers of the Frisian expeditionary corps sent to Brazil (1648). See also Van der Wee, *Growth of the Antwerp Market*, vol I: *Statistics*, Appendix 47:1, pp. 533-37; E. Schokkaert and Herman Van der Wee, 'A Quantitative Study of Food Consumption in the Low Countries During the Sixteenth Century', *Journal of European Economic History*, 17 (Spring 1988), 131 - 58.

⁹³ Source: <http://www.statcan.ca/english/Subjects/Cpi/cpi-en.htm>

⁹⁴ Admittedly, that omission of housing or shelter from the late-medieval 'baskets of consumables' does skew the comparison with the modern Consumer Price Index: for if shelter had been included in the former 'baskets' the shares for food and drink would have been less.

and clothing – though again the distinction between genuine necessities and luxuries, past and present, is always difficult to define with any precision. Nevertheless, that reduction in turn has clearly permitted modern European and North American societies to devote considerably greater consumer expenditures or household budget shares to a much larger, much vaster array of consumer goods, including especially those for housing, many of which historians would consider to be ‘luxuries’. Needless to say, the overwhelming majority of these consumer goods would have been totally inconceivable to our nineteenth-century ancestors, let alone those of the fifteenth and sixteenth centuries.

Whether or not human happiness has progressed to the same degree, since the fifteenth century, is a question best left to moral philosophers. Yet it would be difficult for any to dispute that living far longer, with far healthier lives, is a very distinct advantage over the past, when, to quote the English philosopher Thomas Hobbes (1588-1679), life for so very many was then ‘solitary, poor, nasty, brutish, and short’.⁹⁵ And, presumably the vast number of the poor were not very well dressed either, certainly not compared to their aristocratic ‘superiors’.

⁹⁵ From Thomas Hobbes, *Leviathan* [1651] (London: Pearson Longman, 2008), part 1, chapter 13: cited in *The Columbia World of Quotations* (New York, 1996).

* The Flemish Commodity Price Index (table 3) is used for the period 1351 to 1500, when that price index ceases; the Van der Wee Brabant Commodity Price Index is used for the following period from 1501 to 1570. Thus the 'real' prices for Ghent *dickedinnen* are in terms of the Flemish commodity price index to 1500, and on the Brabant commodity price index thereafter, to 1570.

Harmonic Mean: In computing quinquennial, decennial, or other such mean values, the harmonic mean must be used, not the arithmetic mean. See Harold Sloan and Arnold Zurcher, *A Dictionary of Economics*, 3rd edn (New York, 1953), pp. 149-50: the harmonic mean is 'a calculated average computed by finding the reciprocal of the arithmetic mean of the reciprocals of the numbers to be averaged... In economic computation the harmonic mean is used in averaging such data as time rates and rate-per-dollar prices'.

E. Henry Phelps Brown and Sheila V. Hopkins, 'Seven Centuries of the Prices of Consumables Compared with Builders' Wage-Rates,' *Economica*, 23:92 (November 1956), 296-314; reprinted in E.M. Carus-Wilson, ed., *Essays in Economic History*, 3 vols. (London, 1954-62), vol. II, pp. 179-96, and also in E.H. Phelps Brown and Sheila V. Hopkins, *A Perspective of Wages and Prices* (London, 1981), pp. 13-59, containing tables not presented in their earlier publications. Archives of the British Library of Political and Economic Science (London), Phelps Brown Papers Collection, Box Ia.324. I used their 'workijng papers' and spreadsheets, in order: (a) to correct numerous computational errors; (b) to fill in many gaps by interpolations or by least-squares regressions; and (c) to convert their index numbers, for each commodity, into values in pence (d) sterling.

Figure 1.

The prices and relative values of Ghent *dickedinnen* broadcloths, as purchased for the burgermasters and aldermen of the Ghent civic government, from 1331 to 1570:

expressed in terms of the Flemish pound (£) *groot* (20 shillings to the pound); and in terms of the Commodity Price Indexes of Flanders (1351-1500) and Brabant (1401-1570), with the Nominal and Real Price Indexes for Ghent *dickedinnen* broadcloths, in quinquennial means, 1331-35 to 1566-70.

Figure 2.

The Value of Ghent *dickedinnen* broadcloths, 1331 – 1570, in quinquennial means, as purchased for the burgermasters and aldermen of the Ghent civic government

The nominal and real price indexes for the Ghent *dickedinnen* broadcloths: based on the Flemish Commodity Price Index (1351-1500) and Brabant (1501-1570).

Figure 3.

The Prices and relative values of Ghent *dickedinnen* broadcloths, 1331 – 1570, in quinquennial means, as purchased for the burghermasters and aldermen of the Ghent civic government

Prices in pounds *groot* Flemish (20s = £1 = 240d)

The nominal and real price indexes for the Ghent *dickedinnen* broadcloths: based on the Flemish Commodity Price Index (1351-1500)

Figure 4.

The Values of Ghent *dickedinnen* broadcloths purchased for the burgermasters and aldermen of the Ghent civic government, from 1331 to 1500, in relation to a master mason's daily wage, in quinquennial means:

The number of days' wages that a Bruges master mason would have had to spend to buy one of these broadcloths.

Figure 5.

The Values of Ghent *dickedinnen* broadcloths purchased for the burgermasters and aldermen of the Ghent civic government, from 1401 to 1570, in relation to a master mason's daily wage, in quinquennial means:

The number of days' wages that an Antwerp master mason would have had to spend to buy one of these broadcloths.

Figure 6:

The relative values of Ghent *dickedinnen* broadcloths, as purchased for the bugermasters and aldermen of the Ghent civic government, from 1331 to 1570: in quinquennial harmonic means.

The number of Flemish Commodity Baskets ('Baskets of Consumables') equal to the value of a single Ghent *dickedinnen* broadcloth, 1331-1500, and the number of Brabantine (Antwerp) Commodity Baskets equal to the value of a single Ghent *dickedinnen* broadcloth, from 1401 to 1570.

With the Flemish and Brabantine Commodity Price Indexes.
